

# Nash groups

Anand Pillay

University of Notre Dame

November 11, 2013

- ▶ I will discuss a problem: the classification or description of Nash groups, as well as a solution in the commutative case (joint with Starchenko).

# Introduction

- ▶ I will discuss a problem: the classification or description of Nash groups, as well as a solution in the commutative case (joint with Starchenko).
- ▶ This will also be an opportunity to discuss the model theory of the structure  $(\mathbb{R}, +, \times)$ , real algebraic groups, Lie groups, and the mutual interactions.

# Introduction

- ▶ I will discuss a problem: the classification or description of Nash groups, as well as a solution in the commutative case (joint with Starchenko).
- ▶ This will also be an opportunity to discuss the model theory of the structure  $(\mathbb{R}, +, \times)$ , real algebraic groups, Lie groups, and the mutual interactions.
- ▶ This is in principle an old problem, that I began thinking about in the mid 1980's.

# Introduction

- ▶ This will also be an opportunity to discuss the model theory of the structure  $(\mathbb{R}, +, \times)$ , real algebraic groups, Lie groups, and the mutual interactions.
- ▶ This is in principle an old problem, that I began thinking about in the mid 1980's.
- ▶ But for various reasons, including psychological, it seems to be currently accessible.

# Model theory I

- ▶ The original motivation was model theoretic: the description of definable groups in the structure  $(\mathbb{R}, +, \times)$  up to definable isomorphism.

# Model theory I

- ▶ The original motivation was model theoretic: the description of definable groups in the structure  $(\mathbb{R}, +, \times)$  up to definable isomorphism.
- ▶ A structure  $M$  is simply an underlying set or universe (which I also call  $M$ ) together with some distinguished relations, functions on  $M, M \times M, \dots$

# Model theory I

- ▶ The original motivation was model theoretic: the description of definable groups in the structure  $(\mathbb{R}, +, \times)$  up to definable isomorphism.
- ▶ A structure  $M$  is simply an underlying set or universe (which I also call  $M$ ) together with some distinguished relations, functions on  $M, M \times M, \dots$
- ▶ A first order formula (with respect to a structure  $M$ ) is an expression built up from the distinguished relations and functions, the “logical connectives” and, or, not, as well as “quantifiers” there exists, for all, as well as some variables or indeterminates  $x, y, z, ..$  and parameters from  $M$ .

# Model theory I

- ▶ A structure  $M$  is simply an underlying set or universe (which I also call  $M$ ) together with some distinguished relations, functions on  $M, M \times M, \dots$
- ▶ A first order formula (with respect to a structure  $M$ ) is an expression built up from the distinguished relations and functions, the “logical connectives” and, or, not, as well as “quantifiers” there exists, for all, as well as some variables or indeterminates  $x, y, z, ..$  and parameters from  $M$ .
- ▶ A *definable set* in  $M$  is simply a subset of  $M \times .. \times M$  “defined by” such an expression.

## Model theory II

- ▶ For example a *real algebraic variety*  $X \subseteq \mathbb{R}^n$  is (by definition) a set defined by a finite system of polynomial equations  $P(x_1, \dots, x_n) = 0$  over  $\mathbb{R}$  so is definable in the structure  $(\mathbb{R}, +, \times)$ .

## Model theory II

- ▶ For example a *real algebraic variety*  $X \subseteq \mathbb{R}^n$  is (by definition) a set defined by a finite system of polynomial equations  $P(x_1, \dots, x_n) = 0$  over  $\mathbb{R}$  so is definable in the structure  $(\mathbb{R}, +, \times)$ .
- ▶ The ordering  $x \leq y$  on  $\mathbb{R}$  is definable by the expression  $\exists z(z^2 = y - x)$  (which note has an existential quantifier).

## Model theory II

- ▶ For example a *real algebraic variety*  $X \subseteq \mathbb{R}^n$  is (by definition) a set defined by a finite system of polynomial equations  $P(x_1, \dots, x_n) = 0$  over  $\mathbb{R}$  so is definable in the structure  $(\mathbb{R}, +, \times)$ .
- ▶ The ordering  $x \leq y$  on  $\mathbb{R}$  is definable by the expression  $\exists z(z^2 = y - x)$  (which note has an existential quantifier).
- ▶ A basic theorem (of Tarski) says that that is about it:

## Model theory II

- ▶ For example a *real algebraic variety*  $X \subseteq \mathbb{R}^n$  is (by definition) a set defined by a finite system of polynomial equations  $P(x_1, \dots, x_n) = 0$  over  $\mathbb{R}$  so is definable in the structure  $(\mathbb{R}, +, \times)$ .
- ▶ The ordering  $x \leq y$  on  $\mathbb{R}$  is definable by the expression  $\exists z(z^2 = y - x)$  (which note has an existential quantifier).
- ▶ A basic theorem (of Tarski) says that that is about it:
- ▶  $X \subseteq \mathbb{R}^n$  is definable in  $(\mathbb{R}, +, \times)$  iff  $X$  is *semialgebraic*, namely a finite union of sets of the following kind:

## Model theory II

- ▶ For example a *real algebraic variety*  $X \subseteq \mathbb{R}^n$  is (by definition) a set defined by a finite system of polynomial equations  $P(x_1, \dots, x_n) = 0$  over  $\mathbb{R}$  so is definable in the structure  $(\mathbb{R}, +, \times)$ .
- ▶ The ordering  $x \leq y$  on  $\mathbb{R}$  is definable by the expression  $\exists z(z^2 = y - x)$  (which note has an existential quantifier).
- ▶ A basic theorem (of Tarski) says that that is about it:
- ▶  $X \subseteq \mathbb{R}^n$  is definable in  $(\mathbb{R}, +, \times)$  iff  $X$  is *semialgebraic*, namely a finite union of sets of the following kind:
- ▶  $\{\bar{x} \in \mathbb{R}^n : f(\bar{x}) = 0 \wedge \bigwedge_{i=1, \dots, m} g_i(\bar{x}) > 0\}$  where  $f$  and the  $g_i$  are polynomials over  $\mathbb{R}$ .

## Model theory II

- ▶ For example a *real algebraic variety*  $X \subseteq \mathbb{R}^n$  is (by definition) a set defined by a finite system of polynomial equations  $P(x_1, \dots, x_n) = 0$  over  $\mathbb{R}$  so is definable in the structure  $(\mathbb{R}, +, \times)$ .

- ▶  $X \subseteq \mathbb{R}^n$  is definable in  $(\mathbb{R}, +, \times)$  iff  $X$  is *semialgebraic*, namely a finite union of sets of the following kind:
- ▶  $\{\bar{x} \in \mathbb{R}^n : f(\bar{x}) = 0 \wedge \bigwedge_{i=1, \dots, m} g_i(\bar{x}) > 0\}$  where  $f$  and the  $g_i$  are polynomials over  $\mathbb{R}$ .
- ▶ The real exponential function is not semialgebraic.

# Model theory III

- ▶ The model-theoretic understanding of a structure  $M$  involves the description or classification of sets definable in  $M$ , up to definable bijection.

# Model theory III

- ▶ The model-theoretic understanding of a structure  $M$  involves the description or classification of sets definable in  $M$ , up to definable bijection.
- ▶ A definable group in a structure  $M$  is just a group such that both the underlying set and (graph of the) group operation are definable.

# Model theory III

- ▶ The model-theoretic understanding of a structure  $M$  involves the description or classification of sets definable in  $M$ , up to definable bijection.
- ▶ A definable group in a structure  $M$  is just a group such that both the underlying set and (graph of the) group operation are definable.
- ▶ So the original motivation was: describe the definable groups in  $(\mathbb{R}, +, \times)$ , equivalently semialgebraic groups, up to definable isomorphism.

# Model theory III

- ▶ The model-theoretic understanding of a structure  $M$  involves the description or classification of sets definable in  $M$ , up to definable bijection.
- ▶ A definable group in a structure  $M$  is just a group such that both the underlying set and (graph of the) group operation are definable.
- ▶ So the original motivation was: describe the definable groups in  $(\mathbb{R}, +, \times)$ , equivalently semialgebraic groups, up to definable isomorphism.
- ▶ Note that any real algebraic group (both the underlying set and group operation are given by polynomials) is semialgebraic.

# Model theory III

- ▶ The model-theoretic understanding of a structure  $M$  involves the description or classification of sets definable in  $M$ , up to definable bijection.
- ▶ A definable group in a structure  $M$  is just a group such that both the underlying set and (graph of the) group operation are definable.
- ▶ So the original motivation was: describe the definable groups in  $(\mathbb{R}, +, \times)$ , equivalently semialgebraic groups, up to definable isomorphism.
- ▶ Note that any real algebraic group (both the underlying set and group operation are given by polynomials) is semialgebraic.
- ▶ On the face of it a semialgebraic group need not be a topological group: the interval  $[0, 1)$  with group operation  $+$  modulo 1, is a definable group, but is not, at least naively, a topological group.

# Nash manifolds I

- ▶ Nash manifolds originated in work of John Nash (1952) where he introduced “real algebraic manifolds”, which in current parlance are “compact affine Nash manifolds”. (The complex analogues are the Moishezon compact complex manifolds.)

# Nash manifolds I

- ▶ Nash manifolds originated in work of John Nash (1952) where he introduced “real algebraic manifolds”, which in current parlance are “compact affine Nash manifolds”. (The complex analogues are the Moishezon compact complex manifolds.)
- ▶ Nash manifolds appear again in work of Artin and Mazur (1965) in connection with dynamical systems, and were systematically studied in books by Shiota and Coste-Roy in the 80's.

# Nash manifolds I

- ▶ Nash manifolds originated in work of John Nash (1952) where he introduced “real algebraic manifolds”, which in current parlance are “compact affine Nash manifolds”. (The complex analogues are the Moishezon compact complex manifolds.)
- ▶ Nash manifolds appear again in work of Artin and Mazur (1965) in connection with dynamical systems, and were systematically studied in books by Shiota and Coste-Roy in the 80's.
- ▶ Firstly if  $U$  is an open semialgebraic subset of  $\mathbb{R}^n$ , then a function  $f : U \rightarrow \mathbb{R}$  is said to be Nash if  $f$  is both analytic and semialgebraic, which essentially means that there is a polynomial  $P(\bar{x}, y)$  such that  $P(\bar{x}, f(\bar{x})) = 0$  for all  $\bar{x} \in U$ . (e.g.  $f(x) = +\sqrt{x}$  on  $(0, \infty)$ ).

# Nash manifolds II

- ▶ An ( $n$ -dimensional) Nash manifold is a Hausdorff topological space  $X$  with a covering by *finitely many* open sets  $V_i$ , each homeomorphic via some  $f_i$  to an open semialgebraic subset  $U_i$  of  $\mathbb{R}^n$  such that the transition maps  $f_i \circ f_j^{-1}$  between the open semialgebraic sets  $f_j(V_i \cap V_j)$  and  $f_i(V_i \cap V_j)$  are Nash (i.e each coordinate is Nash).

# Nash manifolds II

- ▶ An ( $n$ -dimensional) Nash manifold is a Hausdorff topological space  $X$  with a covering by *finitely many* open sets  $V_i$ , each homeomorphic via some  $f_i$  to an open semialgebraic subset  $U_i$  of  $\mathbb{R}^n$  such that the transition maps  $f_i \circ f_j^{-1}$  between the open semialgebraic sets  $f_j(V_i \cap V_j)$  and  $f_i(V_i \cap V_j)$  are Nash (i.e each coordinate is Nash).
- ▶ Intuitively a Nash manifold is a *definable* or *semialgebraic* real analytic manifold.

# Nash manifolds II

- ▶ An ( $n$ -dimensional) Nash manifold is a Hausdorff topological space  $X$  with a covering by *finitely many* open sets  $V_i$ , each homeomorphic via some  $f_i$  to an open semialgebraic subset  $U_i$  of  $\mathbb{R}^n$  such that the transition maps  $f_i \circ f_j^{-1}$  between the open semialgebraic sets  $f_j(V_i \cap V_j)$  and  $f_i(V_i \cap V_j)$  are Nash (i.e each coordinate is Nash).
- ▶ Intuitively a Nash manifold is a *definable* or *semialgebraic* real analytic manifold.
- ▶ By a *locally Nash manifold* we mean as above, except that we allow the possibility of infinitely many  $V_i$ . And again this is intuitively a “locally definable” or “ind-definable” real analytic manifold.

# Nash manifolds II

- ▶ An ( $n$ -dimensional) Nash manifold is a Hausdorff topological space  $X$  with a covering by *finitely many* open sets  $V_i$ , each homeomorphic via some  $f_i$  to an open semialgebraic subset  $U_i$  of  $\mathbb{R}^n$  such that the transition maps  $f_i \circ f_j^{-1}$  between the open semialgebraic sets  $f_j(V_i \cap V_j)$  and  $f_i(V_i \cap V_j)$  are Nash (i.e. each coordinate is Nash).
- ▶ Intuitively a Nash manifold is a *definable* or *semialgebraic* real analytic manifold.
- ▶ By a *locally Nash manifold* we mean as above, except that we allow the possibility of infinitely many  $V_i$ . And again this is intuitively a “locally definable” or “ind-definable” real analytic manifold.
- ▶ There is a natural notion of a Nash map between Nash manifolds, and a Nash group is a Nash manifold  $X$  with group operation given by a Nash map  $X \times X \rightarrow X$  (i.e. a group object in the category of Nash manifolds).

- ▶ Likewise for local versions (locally Nash group).

# Nash manifolds III

- ▶ Likewise for local versions (locally Nash group).
- ▶ A Nash manifold is said to be affine if it has a Nash embedding in some  $\mathbb{R}^n$ .

# Nash manifolds III

- ▶ Likewise for local versions (locally Nash group).
- ▶ A Nash manifold is said to be affine if it has a Nash embedding in some  $\mathbb{R}^n$ .
- ▶ Somewhat paradoxically real projective space is affine as a Nash manifold, via stereographic projection, whereby any real nonsingular quasiprojective variety is affine as a Nash manifold.

# Nash manifolds III

- ▶ Likewise for local versions (locally Nash group).
- ▶ A Nash manifold is said to be affine if it has a Nash embedding in some  $\mathbb{R}^n$ .
- ▶ Somewhat paradoxically real projective space is affine as a Nash manifold, via stereographic projection, whereby any real nonsingular quasiprojective variety is affine as a Nash manifold.
- ▶ Conversely it was proved that any affine Nash manifold is Nash isomorphic to a nonsingular real algebraic variety.

# Nash manifolds III

- ▶ Likewise for local versions (locally Nash group).
- ▶ A Nash manifold is said to be affine if it has a Nash embedding in some  $\mathbb{R}^n$ .
- ▶ Somewhat paradoxically real projective space is affine as a Nash manifold, via stereographic projection, whereby any real nonsingular quasiprojective variety is affine as a Nash manifold.
- ▶ Conversely it was proved that any affine Nash manifold is Nash isomorphic to a nonsingular real algebraic variety.
- ▶  $\mathbb{R}/\mathbb{Z}$  has naturally the structure of a Nash manifold:  $[0, 1]$  with  $0, 1$  identified, but it is non affine. In general little is known about arbitrary (not necessarily affine) Nash manifolds.

# Nash groups I

We mention some early results:

## Theorem 0.1

*(P 1986 ) Any semialgebraic group  $G$  can be semialgebraically equipped with the structure of a Nash group (in particular a Lie group) unique up to Nash isomorphism. The category of semialgebraic groups coincides with that of Nash groups.*

# Nash groups I

We mention some early results:

## Theorem 0.1

*(P 1986 ) Any semialgebraic group  $G$  can be semialgebraically equipped with the structure of a Nash group (in particular a Lie group) unique up to Nash isomorphism. The category of semialgebraic groups coincides with that of Nash groups.*

We have four categories: real algebraic groups  $\subset$  Nash groups  $\subset$  locally Nash groups  $\subset$  Lie groups.

# Nash groups I

We have four categories: real algebraic groups  $\subset$  Nash groups  $\subset$  locally Nash groups  $\subset$  Lie groups.

## Theorem 0.2

*(Hrushovski-P, 1994, with model theory proof) Any Nash group  $G$  is locally, Nash isomorphic to a real algebraic group  $H$  in the sense that there is Nash isomorphism between open semialgebraic neighbourhoods of the identity of  $G$  and of  $H$ .*

# Nash groups II

- ▶ Earlier, in the late 80's Madden-Stanton had noted the one-dimensional case of Theorem 0.2 and used it to classify one-dimensional Nash groups (included in our main result, to be stated later). In particular there are many distinct incarnations of the 1-dimensional compact Lie group  $S^1$  as Nash groups. Examples....

# Nash groups II

- ▶ Earlier, in the late 80's Madden-Stanton had noted the one-dimensional case of Theorem 0.2 and used it to classify one-dimensional Nash groups (included in our main result, to be stated later). In particular there are many distinct incarnations of the 1-dimensional compact Lie group  $S^1$  as Nash groups. Examples....
- ▶ We used Theorem 0.2 to prove the following (Hrushovski-P, 1994, with corrected proof 2012):

## Theorem 0.3

*The affine Nash groups are precisely the finite covers of real algebraic groups.*

# Nash groups II

- ▶ We used Theorem 0.2 to prove the following (Hrushovski-P, 1994, with corrected proof 2012):

## Theorem 0.3

*The affine Nash groups are precisely the finite covers of real algebraic groups.*

Note this already takes us out of the category of algebraic groups: the proper finite covers of  $SL(2, \mathbb{R})$  are neither real algebraic nor linear.

We have the following easy fact about locally Nash groups:

## Theorem 0.4

*The class of locally Nash groups is closed under taking universal covers and quotients by discrete subgroups.*

We have the following easy fact about locally Nash groups:

## Theorem 0.4

*The class of locally Nash groups is closed under taking universal covers and quotients by discrete subgroups.*

We conclude from Theorem 0.2 a classification of *locally Nash groups*.

We have the following easy fact about locally Nash groups:

## Theorem 0.4

*The class of locally Nash groups is closed under taking universal covers and quotients by discrete subgroups.*

We conclude from Theorem 0.2 a classification of *locally Nash groups*.

## Corollary 0.5

*The locally Nash groups are, up to local Nash isomorphism precisely the quotients of universal covers of real algebraic groups by discrete subgroups.*

# Problem

- ▶ To answer the original problem of classifying Nash groups up to Nash isomorphism, by Theorem 0.2, we must carry out the following:

# Problem

- ▶ To answer the original problem of classifying Nash groups up to Nash isomorphism, by Theorem 0.2, we must carry out the following:
- ▶ (i) For any real algebraic group  $G$ , describe those discrete subgroups  $\Gamma$  of the universal cover  $\tilde{G}$  such that the locally Nash group  $\tilde{G}/\Gamma$  has a compatible structure of Nash group. (For example the universal cover of  $SL(2, \mathbb{R})$  does not itself have the structure of a Nash group.)

# Problem

- ▶ To answer the original problem of classifying Nash groups up to Nash isomorphism, by Theorem 0.2, we must carry out the following:
- ▶ (i) For any real algebraic group  $G$ , describe those discrete subgroups  $\Gamma$  of the universal cover  $\tilde{G}$  such that the locally Nash group  $\tilde{G}/\Gamma$  has a compatible structure of Nash group. (For example the universal cover of  $SL(2, \mathbb{R})$  does not itself have the structure of a Nash group.)
- ▶ (ii) Classify the resulting Nash groups up to Nash isomorphism.

# Problem

- ▶ To answer the original problem of classifying Nash groups up to Nash isomorphism, by Theorem 0.2, we must carry out the following:
- ▶ (i) For any real algebraic group  $G$ , describe those discrete subgroups  $\Gamma$  of the universal cover  $\tilde{G}$  such that the locally Nash group  $\tilde{G}/\Gamma$  has a compatible structure of Nash group. (For example the universal cover of  $SL(2, \mathbb{R})$  does not itself have the structure of a Nash group.)
- ▶ (ii) Classify the resulting Nash groups up to Nash isomorphism.
- ▶ We will answer question (i) in the commutative case, and give some examples showing some subtleties around (ii) compared to the one-dimensional case.

# Commutative real algebraic groups

- ▶ We need to know something of the structure of commutative real algebraic groups  $G$  (where we feel free to pass to real connected components).

# Commutative real algebraic groups

- ▶ We need to know something of the structure of commutative real algebraic groups  $G$  (where we feel free to pass to real connected components).
- ▶ A basic fact is that there is an exact sequence (of real algebraic groups)  $0 \rightarrow L \rightarrow G \rightarrow C \rightarrow 0$ , where

- ▶  $C$  itself is understood by an exact sequence  $0 \rightarrow C_1 \rightarrow C \rightarrow C_2 \rightarrow 0$  where  $C_1$  is a product of copies of  $SO(2, \mathbb{R})$  and  $C_2$  a real abelian variety.
- ▶ This passes to universal covers: in particular we have  $0 \rightarrow L \rightarrow \tilde{G} \xrightarrow{\pi} \tilde{C} \rightarrow 0$ .

# Result

We have, with above notation the solution to (i) in the commutative case:

## Theorem 0.6

*(P-Starchenko, 2013) Let  $G$  be a commutative real algebraic group, and let  $\Gamma$  be a discrete subgroup of  $\tilde{G}$  (maybe trivial). Then  $\tilde{G}/\Gamma$  has a (compatible) structure of Nash group just if  $\tilde{C}/\pi(\Gamma)$  is compact.*

We have, with above notation the solution to (i) in the commutative case:

## Theorem 0.6

*(P-Starchenko, 2013) Let  $G$  be a commutative real algebraic group, and let  $\Gamma$  be a discrete subgroup of  $\tilde{G}$  (maybe trivial). Then  $\tilde{G}/\Gamma$  has a (compatible) structure of Nash group just if  $\tilde{C}/\pi(\Gamma)$  is compact.*

- ▶ Some ingredients in the proof are:

We have, with above notation the solution to (i) in the commutative case:

## Theorem 0.6

*(P-Starchenko, 2013) Let  $G$  be a commutative real algebraic group, and let  $\Gamma$  be a discrete subgroup of  $\tilde{G}$  (maybe trivial). Then  $\tilde{G}/\Gamma$  has a (compatible) structure of Nash group just if  $\tilde{C}/\pi(\Gamma)$  is compact.*

- ▶ Some ingredients in the proof are:
- ▶ The (obvious) fact that a compact locally Nash group is Nash.

We have, with above notation the solution to (i) in the commutative case:

## Theorem 0.6

*(P-Starchenko, 2013) Let  $G$  be a commutative real algebraic group, and let  $\Gamma$  be a discrete subgroup of  $\tilde{G}$  (maybe trivial). Then  $\tilde{G}/\Gamma$  has a (compatible) structure of Nash group just if  $\tilde{C}/\pi(\Gamma)$  is compact.*

- ▶ Some ingredients in the proof are:
- ▶ The (obvious) fact that a compact locally Nash group is Nash.
- ▶ The universal cover of either  $SO(2, \mathbb{R})$  or a real abelian variety does not have the compatible structure of a Nash group (a point that seems to have been overlooked by Madden-Stanton).

We have, with above notation the solution to (i) in the commutative case:

## Theorem 0.6

*(P-Starchenko, 2013) Let  $G$  be a commutative real algebraic group, and let  $\Gamma$  be a discrete subgroup of  $\tilde{G}$  (maybe trivial). Then  $\tilde{G}/\Gamma$  has a (compatible) structure of Nash group just if  $\tilde{C}/\pi(\Gamma)$  is compact.*

- ▶ The universal cover of either  $SO(2, \mathbb{R})$  or a real abelian variety does not have the compatible structure of a Nash group (a point that seems to have been overlooked by Madden-Stanton).
- ▶  $\tilde{G}/\Gamma$  has structure of Nash (definable) group if and only if  $\tilde{G}$  has a “definable fundamental region” for  $\Gamma$ .

# Fundamental region I

- ▶ A fundamental region  $\Omega$  of  $\tilde{G}$  for  $\Gamma$  is simply a neighbourhood  $\Omega$  of 0 in  $\tilde{G}$  such that every coset of  $\Gamma$  in  $\tilde{G}$  meets  $\Omega$  and both  $\Omega$  and  $\Omega + \Omega$  contain only finitely many elements of  $\Gamma$ .

# Fundamental region I

- ▶ A fundamental region  $\Omega$  of  $\tilde{G}$  for  $\Gamma$  is simply a neighbourhood  $\Omega$  of 0 in  $\tilde{G}$  such that every coset of  $\Gamma$  in  $\tilde{G}$  meets  $\Omega$  and both  $\Omega$  and  $\Omega + \Omega$  contain only finitely many elements of  $\Gamma$ .
- ▶ Such a fundamental region is *definable* if  $\Omega$  is a definable subset of the locally definable  $\tilde{G}$  and the restriction of  $+$  to  $\Omega$  is definable.

# Fundamental region I

- ▶ A fundamental region  $\Omega$  of  $\tilde{G}$  for  $\Gamma$  is simply a neighbourhood  $\Omega$  of 0 in  $\tilde{G}$  such that every coset of  $\Gamma$  in  $\tilde{G}$  meets  $\Omega$  and both  $\Omega$  and  $\Omega + \Omega$  contain only finitely many elements of  $\Gamma$ .
- ▶ Such a fundamental region is *definable* if  $\Omega$  is a definable subset of the locally definable  $\tilde{G}$  and the restriction of  $+$  to  $\Omega$  is definable.
- ▶ The choice of a definable fundamental region in  $\tilde{G}$  for  $\Gamma$  determines a Nash or definable group structure on  $\tilde{G}/\Gamma$  (in the obvious way; explain).

# Fundamental region I

- ▶ A fundamental region  $\Omega$  of  $\tilde{G}$  for  $\Gamma$  is simply a neighbourhood  $\Omega$  of 0 in  $\tilde{G}$  such that every coset of  $\Gamma$  in  $\tilde{G}$  meets  $\Omega$  and both  $\Omega$  and  $\Omega + \Omega$  contain only finitely many elements of  $\Gamma$ .
- ▶ Such a fundamental region is *definable* if  $\Omega$  is a definable subset of the locally definable  $\tilde{G}$  and the restriction of  $+$  to  $\Omega$  is definable.
- ▶ The choice of a definable fundamental region in  $\tilde{G}$  for  $\Gamma$  determines a Nash or definable group structure on  $\tilde{G}/\Gamma$  (in the obvious way; explain).
- ▶ The interesting new phenomena, compared with the one-dimensional case, is that different choices of definable fundamental region may give non isomorphic Nash group structures on the same locally Nash group  $\tilde{G}/\Gamma$ .

## Fundamental region II

- ▶ An example is  $\tilde{G} = G = L = (\mathbb{R}, +) \times (\mathbb{R}_{>0}, \times)$ .

## Fundamental region II

- ▶ An example is  $\tilde{G} = G = L = (\mathbb{R}, +) \times (\mathbb{R}_{>0}, \times)$ .
- ▶ By Theorem 0.6 any quotient of  $L$  by a discrete subgroup has Nash group structure.

## Fundamental region II

- ▶ An example is  $\tilde{G} = G = L = (\mathbb{R}, +) \times (\mathbb{R}_{>0}, \times)$ .
- ▶ By Theorem 0.6 any quotient of  $L$  by a discrete subgroup has Nash group structure.
- ▶ Let  $\Gamma$  be the cyclic subgroup of  $L$  generated by  $(1, 2)$ .

## Fundamental region II

- ▶ An example is  $\tilde{G} = G = L = (\mathbb{R}, +) \times (\mathbb{R}_{>0}, \times)$ .
- ▶ By Theorem 0.6 any quotient of  $L$  by a discrete subgroup has Nash group structure.
- ▶ Let  $\Gamma$  be the cyclic subgroup of  $L$  generated by  $(1, 2)$ .
- ▶ Then we have at least two definable fundamental regions in  $L$  for  $\Gamma$ :
