How to access Maple 9 on a Sun workstation in a cluster

Since Maple 7 is the default version of Maple on the cluster machines, you have to do something special to use Maple 9. There are two methods. One is to give the command

module load maple/9.0

Once you do that, Maple 9 will be your default. You can set things up so that the command is automatically given, by adding the line

module load maple/9.0

to your .cshrc file (assuming you use csh as your shell).
Then you give the command

xmaple

If you find this too slow, you can use the "classic worksheet" interface (which is not as nice as the new one) by giving the command

maple -cw

The second method is to give the command

/usr/local/src/maple9/bin/xmaple

or if you want the "classic worksheet"

/usr/local/src/maple9/bin/maple -cw

You can create an alias or a shell script for these commands so you don't have to type so much each time.
