8.(10 pts.) The following is a sequence of consecutive wins and losses for 50 games for the Milwaukee Brewers in the 2014 season:

W L L W W W W W W W W W W L L W L W W W W L W W W L W W L L W L L

W L L L W W W L W W L L L L L W L W L

The team won roughly 50% of their games in 2014.

let W we the event that the game chosen is a win,
let WP be the event that the game prior to the one chosen was a win,

(a) How many of the above outcomes are in WP?
(it might help to circle these outcomes in the data).

(b) What is $P(W|WP)$?

(c) What is $P(W)$?

(d) Would you say that there is evidence of a hot hand effect in the data?

9.(10 pts.)

\begin{aligned}
2x + y - z + 3w &= 8 \\
x - 10y + 4z + w &= 10 \\
3x + y + z &= 5
\end{aligned}
$$

(a) Write the above system of equations as a matrix equation $CX = D$.

(b) Write the following system of equations as a matrix equation $AX = B$.

$$
\begin{aligned}

(b) What is the expected length of the longest run of heads in a sequence of heads and tails generated by flipping a fair coin 50 times?

(c) Based on your results in parts (a) and (b), do you think it is likely that the probability of winning remained constant at 0.5 for the Milwaukee Brewers throughout this sequence of games?
