## Lecture 2 : Borda's method: A Scoring System

In the plurality and runoff methods discussed in the previous lecture, we do not take into account the voter's relative preferences for all of the candidates. We do not, for example take into account which candidate was ranked last by each voter. In this and the following section, we assume that voters are required to list a full set of preferences on their ballot and we look at methods that use all of the information.

## Borda's Method

With Borda's method voters rank the entire list of candidates or choices in order of preference from the first choice to the last choice.
After all votes have been cast, they are tallied as follows:
On a particular ballot, the lowest ranking candidate is given 1 point, the second lowest is given 2 points, and so on, the top candidate receiving points equal to the number of candidates.
The number of points given to each caniddate is summed across all ballots.
This is called the Borda Count for the candidate. The winner is the candidate with the highest Borda count.

Example 1 A committee of 10 people needs to select a chair from among three candidates named Kelly, Holtz, Rockne. They decide to use Borda's method. The preference rankings of the ten committee members are as follows:

| \# Voters $\rightarrow$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{3}$ |
| :---: | :---: | :---: | :---: | :---: |
| Kelly | 1 | 3 | 2 | 3 |
| Holtz | 2 | 1 | 1 | 2 |
| Rockne | 3 | 2 | 3 | 1 |

Who will be the winner using Borda's method?

The Borda count for Kelly is given by:
(no. 1st place votes) $3+($ no. 2 nd place votes $) 2+($ no. 3 rd place votes $) 1=2 \cdot 3+2 \cdot 2+6 \cdot 1=6+4+6=16$.
The Borda count for Holtz is given by:
(no. 1 st place votes) $3+($ no. 2 nd place votes $) 2+($ no. 3 rd place votes $) 1=5 \cdot 3+5 \cdot 2+0 \cdot 1=15+10+0=25$.

The Borda count for Rockne is given by:
(no. 1st place votes) $3+$ (no. 2 nd place votes) $2+$ (no. 3rd place votes) $1=3 \cdot 3+3 \cdot 2+4 \cdot 1=9+6+4=19$. (Not that in this case the winner using the Borda method agrees with the winner using the Plurality method)

Example 2 Suppose that in a survey, squash players were asked to rank brands of squash racquets. The results are shown below:

| \# Players $\rightarrow$ | $\mathbf{3 3}$ | $\mathbf{3}$ | $\mathbf{1 0}$ | $\mathbf{2 0}$ | $\mathbf{7}$ | $\mathbf{2 7}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Dunlop | 1 | 1 | 2 | 3 | 2 | 3 |
| Black Knight | 2 | 3 | 1 | 1 | 3 | 2 |
| Prince | 3 | 2 | 3 | 2 | 1 | 1 |

(a) Which brand would win using Borda's method?
(b) Which brand would win using the Plurality method?
(c) Which brand would win using the Plurality method with a runoff between the first and second place finishers?

Note: One could also apply Borda's method by just adding the rankings as they are and the person with the lowest point total wins. In some variations of Borda's method shown below this approach is no longer feasible.
Note: If there are n candidates a k th place vote adds a total of $n+1-k$ to that candidates Borda Count. You should be able to use this come up with an easy formula to calculate the Borda count in the example below. (This formula is also invalid for some variations of the Borda method.)

Example 3; A variation of the Borda Count The 2000 preseason rankings for the Big East college football teams are shown below, where the voters were various publications ( $\mathrm{SN}=$ Sports News, $\mathrm{SI}=$ Sports Illustrated etc...)

Big East, Preseason rankings, 2000

| Team $\downarrow$ | $A T$ | $S N$ | $L$ | $P S$ | $S S$ | $C F N$ | $A T S$ | $S I$ | $P S$ | $S N$ | $C N N$ | $C P A$ | $F A$ | $G P$ | $J F$ | $C P$ | $B R$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Pittsburgh | 5 | 6 | 4 | 4 | 4 | 4 | 3 | 5 | 5 | 4 | 6 | 4 | 4 | 5 | 4 | 4 | 6 |
| Miami-FL | 1 | 1 | 1 | 1 | 1 | 2 | 1 | 1 | 1 | 1 | 1 | 1 | 2 | 2 | 1 | 2 | 1 |
| Boston College | 3 | 3 | 5 | 6 | 5 | 6 | 4 | 3 | 4 | 5 | 5 | 5 | 5 | 6 | 6 | 5 | 4 |
| Virginia Tech | 2 | 2 | 2 | 3 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 1 | 1 | 2 | 1 | 2 |
| Rutgers | 8 | 8 | 8 | 7 | 8 | 8 | 8 | 8 | 7 | 8 | 8 | 8 | 8 | 8 | 7 | 8 | 7 |
| Syracuse | 4 | 4 | 3 | 2 | 3 | 2 | 5 | 4 | 3 | 3 | 3 | 3 | 3 | 3 | 3 | 3 | 3 |
| Temple | 7 | 7 | 7 | 8 | 7 | 7 | 7 | 7 | 8 | 6 | 7 | 7 | 6 | 7 | 8 | 7 | 8 |
| West Virginia | 6 | 5 | 6 | 5 | 6 | 5 | 6 | 6 | 6 | 7 | 4 | 6 | 7 | 4 | 5 | 7 | 5 |

Note that CFN (College Football News) has not ranked its preferences 1-8, instead it has given the top three teams a rank of 2 each. We will assign a Borda count of $9-2=7$ to each of these votes. Also College and Pro Football Newsweekly (CP) has ranked two teams as 7 instead of assigning a 6 and a 7. We will give each of these teams a Borda count of $9-7=2$.

Use Borda's method to determine a ranking for the teams using the sums of the above rankings shown below:

| Team | Pitt. | Miami | BC | VT | Rutgers | Syr. | Temple | WV |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Sum | 77 | 21 | 80 | 32 | 132 | 54 | 121 | 96 |

Formula for Borda Count When using the Borda Method with $c$ candidates and $v$ voters. For any given candidate, let $r_{1}, r_{2}, \ldots, r_{v}$ demote the ranks assigned to that candidate by each voter. Let $s$ denote their sum $s=r_{1}+r_{2}+\cdots+r_{v}$. Then the Borda count for that candidate is given by

$$
b=v(c+1)-s
$$

## Strategic Voting and Borda's Method

Example 4 There are 4 candidates for the position of President for the Notre Dame Table Tennis Club. The preferences of the 10 members of the club are shown in the following table:

## Presidential preference rankings

| \#Voters | $\mathbf{1}$ | $\mathbf{1}$ | $\mathbf{1}$ | $\mathbf{3}$ | $\mathbf{1}$ | $\mathbf{1}$ | $\mathbf{1}$ | $\mathbf{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| G. Devaney | 1 | 1 | 1 | 2 | 2 | 3 | 4 | 4 |
| K. Shields. | 2 | 3 | 3 | 4 | 4 | 2 | 2 | 3 |
| J. Gonzales | 3 | 2 | 4 | 1 | 3 | 4 | 3 | 2 |
| N. Li | 4 | 4 | 2 | 3 | 1 | 1 | 1 | 1 |

(a) Which candidate will win if the Borda Method is used?
(b) Could the club member who voted for Li first, Devaney second, Gonzales third and Shields fourth have voted strategically to change the outcome so that Li came first when votes were counted using Borda's method (assuming the other members of the club vote as indicated in the table)?
(c) Could the two club members who voted for Li first and Devaney fourth have influenced the outcome by voting strategically (assuming the other members of the club vote as indicated in the table)?

## Parity Check

Since the Borda method involves a lot of calculation, it is easy to make a mistake. we can use the formula given below to run a quick check on our answers.

Parity Check When using Borda's method with $c$ candidates and $v$ voters, the sum of the Borda counts for all candidates must be

$$
\frac{v c(c+1)}{2} .
$$

Proof Since each voter contributes a total of $1+2+3+\cdots+c$ to the sum of the Borda counts, the sum of the Borda counts must be $v(1+2+3+\cdots+c)$. A visual proof of this formula is given below.

$1+2+\cdots+n=\frac{1}{2} n(n+1)$

$1+2+\cdots+n=\frac{n^{2}}{2}+\frac{n}{2}$

Example Find $1+2+3+\cdots+50$ ?

Check the value of the sum of all Borda counts predicted by the above parity check for the examples discussed above:
Example 1

| \# Voters $\rightarrow$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{3}$ |
| :---: | :---: | :---: | :---: | :---: |
| Kelly | 1 | 3 | 2 | 3 |
| Holtz | 2 | 1 | 1 | 2 |
| Rockne | 3 | 2 | 3 | 1 |

|  | Borda Count |
| :---: | :---: |
| Kelly | 16 |
| Holtz | 25 |
| Rockne | 19 |

$$
v=10, \quad c=3
$$

## Example 2:

| \# Players $\rightarrow$ | $\mathbf{3 3}$ | $\mathbf{3}$ | $\mathbf{1 0}$ | $\mathbf{2 0}$ | $\mathbf{7}$ | $\mathbf{2 7}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Dunlop | 1 | 1 | 2 | 3 | 2 | 3 |
| Black Knight | 2 | 3 | 1 | 1 | 3 | 2 |
| Prince | 3 | 2 | 3 | 2 | 1 | 1 |

|  | Borda Count |
| :---: | :---: |
| Dunlop |  |
| Black Knight |  |
| Prince |  |

$$
v=100, \quad c=3 .
$$

## Example 3:

| Team | Pitt. | Miami | BC | VT | Rutgers | Syr. | Temple | WV |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Borda Count | 76 | 132 | 73 | 121 | 21 | 99 | 32 | 57 |
| $\mathrm{v}=17, \quad \mathrm{c}=8$. |  |  |  |  |  |  |  |  |

In this case, we see that the parity check comes up incorrect; why?

## Example 4:

| \#Voters | $\mathbf{1}$ | $\mathbf{1}$ | $\mathbf{1}$ | $\mathbf{3}$ | $\mathbf{1}$ | $\mathbf{1}$ | $\mathbf{1}$ | $\mathbf{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| G. Devaney | 1 | 1 | 1 | 2 | 2 | 3 | 4 | 4 |
| K. Shields. | 2 | 3 | 3 | 4 | 4 | 2 | 2 | 3 |
| J. Gonzales | 3 | 2 | 4 | 1 | 3 | 4 | 3 | 2 |
| N. Li | 4 | 4 | 2 | 3 | 1 | 1 | 1 | 1 |

|  | Borda Count |
| :---: | :---: |
| G. Devaney |  |
| K. Shields. |  |
| J. Gonzales |  |
| N. Li |  |

$$
v=10, \quad c=4
$$

## Advantages, Disadvantages

The advantage of Borda's method over plurality methods is that voters are able to express their opinions about candidates other than just their first choice. This means that a candidate who is ranked highly but not necessarily first by many voters has a good chance of winning when using Borda's method. The disadvantage of using Borda's method is that it is more susceptible to strategic voting than either the Plurality or Runoff Plurality methods.

## Variations of The Borda Count in Sports

In sports polls where this form of voting is commonly used, the voters may know a lot about the top teams or players and be able to rank them, but may not know enough to rank all eligible candidates, so lumping all but the top candidates together with 0 points simplifies the process for voters.

## Heisman Trophy

A variation of this method is used to decide the winner of the Heisman Trophy. On the Heisman ballot voters are asked to rank only their top three choices from among all college football players in the United States. The Borda count for each player is computed by giving 3 points for each first place vote, 2 points for each second place vote and 1 point for each third place vote. The winner is declared to be the candidate with the highest Borda count.

THE 2003 OFFICIAL HEISMAN BALLOT

NBA most valuable player (uses wider spread of points)
To decide on the winner of the National Basketball Association Most Valuable Player award, 116 members of the media list their first through fifth choices for the award. Each first place vote receives 10 points, each second place vote receives 7 points, each third place vote receives 5 points, each fourth place vote receives 3 points and each fifth place vote receives 1 point.

## AP Polls

The Associated Press (AP) college football poll gives a ranking for the top teams in college football. The voters in the AP poll are newspaper, radio and television sports reporters throughout the country. In 2011 there were 60 voters and the final rankings are given in the table below.

| AP Top 25 |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| RK | TEAM | RECORD | PTS | PVS |
| 1 | Alabama (55) | 12-1 | 1495 | 2 |
| 2 | LSU (1) | 13-1 | 1425 | 1 |
| 3 | Oklahoma State (4) | 12-1 | 1399 | 3 |
| 4 | Oregon | 12-2 | 1250 | 6 |
| 5 | Arkansas | 11-2 | 1198 | 7 |
| 6 | USC | 10-2 | 1181 | 5 |
| 7 | Stanford | 11-2 | 1167 | 4 |
| 8 | Boise State | 12-1 | 1127 | 8 |
| 9 | South Carolina | 11-2 | 1013 | 10 |
| 10 | Wisconsin | 11-3 | 905 | 9 |
| 11 | Michigan State | 11-3 | 873 | 12 |
| 12 | Michigan | 11-2 | 839 | 13 |
| 13 | Baylor | 10-3 | 780 | 15 |
| 14 | TCU | 11-2 | 653 | 16 |
| 15 | Kansas State | 10-3 | 621 | 11 |
| 16 | Oklahoma | 10-3 | 572 | 19 |
| 17 | West Virginia | 10-3 | 547 | 23 |
| 18 | Houston | 13-1 | 518 | 20 |
| 19 | Georgia | 10-4 | 439 | 18 |
| 20 | Southern Miss | 12-2 | 411 | 22 |
| 21 | Virginia Tech | 11-3 | 329 | 17 |
| 22 | Clemson | 10-4 | 188 | 14 |
| 23 | Florida State | 9-4 | 154 | 25 |
| 24 | Nebraska | 9-4 | 143 | 21 |
| Others receiving votes: Brigham Young 51, Auburn 40, Northern Illinois 33, Missouri 23, Texas 15, Rutgers 3, North Dakota State 2, Penn State 2, Virginia 1 |  |  |  |  |

BCS Unlike most college sports Division 1A football does not have a playoff to determine the national champion. Instead the Bowl Championship series is a selection system that creates five bowl match-ups involving ten of the top ranked teams in the NCAA Division I. The BCS combines rankings from the Harris Interactive Poll, The Coaches Poll and six computer ranking systems.

The Harris Interactive College Poll uses the Borda method with 113 voting members ranking teams from 1 through 25. The maximum Borda count for any team from this poll is $113 \times 25=2,825$. The Borda count for each team is scaled for use in the BCS ranking to its BCS quotient

$$
\text { Harris Quotient }=\frac{\text { Harris Borda Count for team }}{2825} .
$$

The USA Today Coaches Poll also uses the Borda Method has 59 voting members each season ranking teams from 1 through 25. The maximum possible Borda count for any team from this poll is $59 \times 25=1475$. The Borda count for each team is scaled for use in the BCS ranking to its

BCS quotient

$$
\text { Coaches Quotient }=\frac{\text { Coaches Borda Count for team }}{1475}
$$

The BCS used six computer ranking systems: Jeff Sagarin, Anderson/Hester, Richard Billingsley, Colley Matrix, Kenneth Massey, and Dr. Peter Wolfe. Each ranking system assigns a number between 1 and 25 to each team, 25 to the top ranked team, 24 to the team ranked second, etc... . A team's highest and lowest computer ranking will be discarded from figuring a team's computer poll average. Points will be assigned in inverse order of ranking from 125. The four remaining computer scores will be averaged and the total will be calculated as a percentage of 100 . The highest computer BCS quotient that a team can earn is therefore $(25 \times 4) / 100=1$.

The BCS ratings at the end of each polling period are determined by adding the above 3 quotients together. Sometimes the average of the three quotients are published.

$$
\text { Final BCS rating }=\frac{\text { Harris Quotient }+ \text { Coaches Quotient }+ \text { Computer Quotient }}{3} .
$$

Controversy Because millions of dollars ride on the possibility of playing in the national championship bowl game, and because of the manipulation possible when using the Borda method, the ethical question of whether rankings should be affected by those with a vested interest in the outcome arises. The formula for the BCS ratings was rewritten after the 2004 season. Before 2004, the AP polls were used, however due to the controversial outcome in the 2004 season, the Associated Press no longer allowed its rankings to be used in the BCS formula. It was replaced by the Harris Poll. An excerpt from Wikipedia is shown below and the final two BCS rankings for 2004 are shown in subsequent pages.

## EXPLANATION:

Team percentages are derived by dividing a team's actual voting points by a maximum 1625 possible points in the AP Poll and 1525 possible points in the USA Today/ESPN Coaches Poll.
Six computer rankings calculated in inverse points order (25 for \#1, 24 for \#2, etc.) are used to determine the overall computer component. The best and worst ranking for each team is dropped, and the remaining four are added and divided by 100 (the maximum possible points) to produce a Computer Rankings Percentage. The six computer ranking providers are Anderson \& Hester, Richard Billingsley, Colley Matrix, Kenneth Massey, Jeff Sagarin, and Peter Wolfe. Each computer ranking accounts for schedule strength in its formula. Their individual weekly rankings of all teams may be found at www.BCSfootball.org.

The BCS Average is calculated by averaging the percent totals of the Associated

www.bcsFootball.org Press, USA Today/ESPN Coaches, and Computer polls.

On January 4, 2005, the FedEx Orange Bowl will host the BCS National Championship Game and determine which team will be presented The National Football Foundation and College Hall of Fame's MacArthur Trophy, awarded to college football's National Champion since 1959, as well as the ADT National Championship Trophy on behalf of the American Football Coaches Association.

## EXPLANATION:

Team percentages are derived by dividing a team's actual voting points by a maximum 1625 possible points in the AP Poll and 1525 possible points in the USA Today/ESPN Coaches Poll.
Six computer rankings calculated in inverse points order ( 25 for \#1, 24 for \#2, etc.) are used to determine the overall computer component. The best and worst ranking for each team is dropped, and the remaining four are added and divided by 100 (the maximum possible points) to produce a Computer Rankings Percentage. The six computer ranking providers are Anderson \& Hester, Richard Billingsley, Colley Matrix, Kenneth Massey, Jeff Sagarin, and Peter Wolfe. Each computer ranking accounts for schedule strength in its formula. Their individual weekly rankings of all teams may be found at www.BCSfootball.org.
The BCS Average is calculated by averaging the percent totals of the Associated

www.bcsFootball.org Press, USA Today/ESPN Coaches, and Computer polls.

On January 4, 2005, the FedEx Orange Bowl will host the BCS National Championship Game and determine which team will be presented The National Football Foundation and College Hall of Fame's MacArthur Trophy, awarded to college football's National Champion since 1959, as well as the ADT National Championship Trophy on behalf of the American Football Coaches Association.

[^0]:    As with previous seasons, fans of successful teams left out of the BCS were disappointed. Auburn, Utah, and BSU all went unbeaten but were not offered a chance to compete for the championship. Auburn was especially the focus of national media attention on this topic; many thought that since Auburn managed to go undefeated in the traditionally tough SEC, they deserved a shot at the title. Adding to the BCS frustration was the fact that Auburn and Utah, though both in BCS bowl games, would not be able to play each other as a match-up of highly ranked unbeatens.
    There was also a controversy in selecting the BCS bowls' second at-large team (Utah being the first). The University of California expected to get the invite, being ranked fourth in the BCS entering the last week of the regular season; the Texas Longhorns, who had been left out of the BCS the year before, was fifth before the final BCS rankings were released. Both teams finished at $10-1$, but the Longhorns ultimately received enough support from poll voters to move into the fourth slot, which ensured they would also receive the final at-large bid. Texas coach Mack Brown was criticized for publicly politicking voters to put Texas ahead of California; Cal coach Jeff Tedford called for coaches' votes to be made public. Texas went on to defeat Michigan in the Rose Bowl, while California lost to Texas Tech in the Holiday Bowl.
    The Associated Press, as a result of two consecutive seasons of BCS controversy, prohibited the BCS from using their poll as part of its ranking formula. The AP poll was replaced by the Harris Interactive poll, and the AP continues to award its own national championship trophy.
