## Math 10250 Activity 9: Compound Interest and the Number e (Sec. 2.2)

**Last time:** Let A(t) be the balance at time t (years) of a bank account earning interest at an annual rate r (in decimals) compounded n times a year. Then we have:

$$A(t) = P\left(1 + \frac{r}{n}\right)^{tn}$$

where P is the principal i.e. A(0) = P.

**Example 1** The balance M(t) of a retirement account with interest compounded daily is given by the formula  $M(t) = 30000(1.00022)^{365t}$ . What is the principal and the annual interest rate?

(Ans: P = \$30000; r = 8%)

Next, we want to consider the balance of an account where interest is compounded continuously i.e. we are earning interest every instant the money is with the bank. (Good deal?)

## $\blacktriangleright$ The number e

In the general formula above, if P = 1, r = 1 and t = 1 then  $A(1) = \left(1 + \frac{1}{n}\right)^n$ . Letting n go to  $\infty$  we obtain that:

$$\lim_{n \to \infty} \left( 1 + \frac{1}{n} \right)^n \stackrel{?}{=} \qquad .$$
  $\leftarrow$  balance at end of 1 yr. of an investment of \$1 at an annual interest rate of 100% compounded continuously

**Example 2** Estimate e by completing the table:

n	1	2	10	100	1000
$\left(1+\frac{1}{n}\right)^n$					

## Continuously compounded interest

Compute the limit:

$$\lim_{n \to \infty} \left( 1 + \frac{r}{n} \right)^n = =$$

$$\stackrel{\uparrow}{\underset{\text{letting } m = n/r, \text{ so that } n = mr}{} =$$

$$\stackrel{\uparrow}{\underset{\text{by definition of } n}{}}$$

Setting: As above except now  $n \to \infty$ 

The amount after t years with **continuously compounded interest** is:

$$A(t) = \lim_{n \to \infty} P\left(1 + \frac{r}{n}\right)^{tn} = P \cdot \lim_{n \to \infty} \left[ \int_{n \to \infty}^{t} \left[ \frac{A(t) = Pe^{rt}}{r} \right]^{\leftarrow (rate)(time in years)} + \frac{A(t) = Pe^{rt}}{r}$$

**Example 3** If you open an account paying 9% interest, compounded continuously, then how much should you deposit to insure that there will be \$60,000 in 15 years? Ans.  $_{60,000e^{-1.35}}$ 

**Example 4** 
$$\lim_{n \to \infty} \left( 1 + \frac{1}{2n} \right)^{3n} \stackrel{?}{=}$$
 Ans.  $e^{3/2}$ 

**Example 5** Suppose you put \$5000 in an account paying 4% annual interest, and you leave it there without adding or withdrawing anything. How much will you have at the end of 3 years if the interest is compounded:

- (a) 6 times a year?
  - (b) 24 times a year?
  - (c) continuously?

**Remark:** What could you conclude from the answers obtained in Example 5?

## ▶ The natural exponential function

**Recall:** The exponential function is  $f(x) = b^x$ , where b is a positive constant. The most **popular** b is e. **Definition:** The **natural exponential function** is  $f(x) = e^x$ .

**Example 6** Graph the natural exponential function and its inverse. Write down all intercepts and asymptotes of the natural exponential function.

Ans. \$5,637.48

Ans. \$5,636.92
