

Math 10250 Activity 11: Natural Logarithm and Applications (Sec. 2.4)

GOAL: Define the **natural** Logarithmic function $\ln x$ as the inverse of the **natural** exponential function, $f(x) = e^x$ and use it to solve equations when the unknown is an exponent as is the case when we need to determine doubling time or half-life time.

Last time: We met the logarithmic function with base b . Recall, $\log_b x = y \Leftrightarrow \quad , \quad x > 0$.

Q1: What do we get when we let $b = e$?

A1: The **natural logarithm**, $\ln x = \log_e x$, $x > 0$. Therefore $\ln x = y \Leftrightarrow \quad , \quad x > 0$.

• Since **$\ln x$** is the **inverse** of e^x have the following two useful formulas:

$$\ln(e^x) = \quad , \quad \text{any } x \quad \text{and} \quad e^{\ln x} = \quad , \quad x > 0.$$

Sketch the graph of $\ln x$:

Q2: What are the **basic properties of $\ln x$** ?

A2: • domain $\stackrel{?}{=} \quad$ and range $\stackrel{?}{=} \quad$
 • It's continuous and increasing.
 • $\lim_{x \rightarrow \infty} \ln x \stackrel{?}{=} \quad$ and $\lim_{x \rightarrow 0^+} \ln x \stackrel{?}{=} \quad$.
 • $\ln 1 \stackrel{?}{=} \quad$, $\ln e \stackrel{?}{=} \quad$, and $\ln(1/e) \stackrel{?}{=} \quad$

Example 1 Sketch the graph of $y = \ln(3 + x)$.

Example 2 Solve $e^{3-2x} = 8$ for x .

► Converting exponentials from base b to base e

Q3: How do we convert b^x to $e^{(\text{something})}$?

A3: Using $b = e^{\ln b}$ we have the **conversion formula**: $b^x = (\quad)^x = \quad$.

Example 3 Rewrite $\sqrt[3]{7}$ as an exponential with base e .

Example 4 Evaluate the given expression as a number in decimal form without using a calculator.

(a) $\ln \left(\frac{1}{\sqrt[4]{e}} \right)$

(b) $e^{2 \ln 3}$

Example 5 Simplify $e^{\ln(5x)+\ln(2/x)}$.

► Exponential growth and decay

Recall: In Section 2.1 we saw that the equation for exponential growth and decay was:

$$y = y_0 b^t.$$

Since $b^x = e^{(\ln b)x}$ we can rewrite this as

$$y = y_0 e^{(\ln b)t}.$$

- If $b > 1$ then $\ln b =$ growth constant. \leftarrow exponential growth
- If $0 < b < 1$ then $\ln b < 0$. $|\ln b| =$ decay constant. \leftarrow exponential decay

Example 6 If \$10,000 is deposited in an account paying 5% interest per year, compounded continuously, how long will it take for the balance to reach \$20,000?

Example 7 Polonium-210 has a decay constant of 0.004951, with time measured in days. How long does it take a given quantity of polonium-210 to decay to half the initial amount? In other words, what is the half-life of polonium-210?

Fact: For any radioactive substance: Half-life = _____.

Example 8 A bacteria culture starts with 500 bacteria and is growing exponentially. After 3 hours there are 8000 bacteria.

(a) Find a formula of the form $y = Ae^{kt}$ for the number of bacteria after t hours.

(b) Find the number of bacteria after 4 hours.

(c) When will the population reach 30,000?
