

Contents

1	The experimental origins of quantum mechanics	1
1.1	Is light a wave or a particle?	1
1.2	Is an electron a wave or a particle?	7
1.3	Schrödinger and Heisenberg	13
1.4	A matter of interpretation	14
1.5	Exercises	16
2	A first approach to classical mechanics	19
2.1	Motion in \mathbb{R}^1	19
2.2	Motion in \mathbb{R}^n	23
2.3	Systems of particles	26
2.4	Angular momentum	31
2.5	Poisson brackets and Hamiltonian mechanics	33
2.6	The Kepler problem and the Runge–Lenz vector	41
2.7	Exercises	47
3	A first approach to quantum mechanics	53
3.1	Waves, particles, and probabilities	53
3.2	A few words about operators and their adjoints	55
3.3	Position and the position operator	58
3.4	Momentum and the momentum operator	59
3.5	The position and momentum operators	63
3.6	Axioms of quantum mechanics: operators and measurements	64
3.7	Time-evolution in quantum theory	70

3.8	The Heisenberg picture	78
3.9	Example: A particle in a box	81
3.10	Quantum mechanics for a particle in \mathbb{R}^n	83
3.11	Systems of multiple particles	84
3.12	Physics notation	86
3.13	Exercises	89
4	The free Schrödinger equation	91
4.1	Solution by means of the Fourier transform	92
4.2	Solution as a convolution	94
4.3	Propagation of the wave-packet: first approach	97
4.4	Propagation of wave-packet: second approach	100
4.5	Spread of the wave-packet	104
4.6	Exercises	105
5	A particle in a square well	109
5.1	The time-independent Schrödinger equation	109
5.2	Domain questions and the matching conditions	111
5.3	Finding square-integrable solutions	112
5.4	Tunneling and the classically forbidden region	119
5.5	Discrete and continuous spectrum	120
5.6	Exercises	120
6	Perspectives on the Spectral Theorem	123
6.1	The difficulties with the infinite-dimensional case	123
6.2	The goals of spectral theory	125
6.3	A guide to reading	126
6.4	The position operator	126
6.5	Multiplication operators	127
6.6	The momentum operator	127
7	The Spectral Theorem for bounded self-adjoint operators: statements	131
7.1	Elementary properties of bounded operators	131
7.2	Spectral Theorem for bounded self-adjoint operators, I	137
7.3	Spectral Theorem for bounded self-adjoint operators, II	144
7.4	Exercises	151
8	The Spectral Theorem for bounded self-adjoint operators: proofs	153
8.1	Proof of the Spectral Theorem, first version	153
8.2	Proof of the Spectral Theorem, second version	162
8.3	Exercises	166
9	Unbounded self-adjoint operators	169
9.1	Introduction	169

9.2	Adjoint and closure of an unbounded operator	170
9.3	Elementary properties of adjoints and closed operators . . .	173
9.4	The spectrum of an unbounded operator	176
9.5	Conditions for self-adjointness and essential self-adjointness	179
9.6	A counterexample	182
9.7	An example	184
9.8	The basic operators of quantum mechanics	185
9.9	Sums of self-adjoint operators	190
9.10	Another counterexample	193
9.11	Exercises	196
10	The Spectral Theorem for unbounded self-adjoint operators	201
10.1	Statements of the Spectral Theorem	202
10.2	Stone's Theorem and one-parameter unitary groups	207
10.3	The Spectral Theorem for bounded normal operators	213
10.4	Proof of the Spectral Theorem for unbounded self-adjoint operators	220
10.5	Exercises	224
11	The harmonic oscillator	227
11.1	The role of the harmonic oscillator	227
11.2	The algebraic approach	228
11.3	The analytic approach	232
11.4	Domain conditions and completeness	233
11.5	Exercises	237
12	The uncertainty principle	239
12.1	Uncertainty principle, first version	241
12.2	A counterexample	245
12.3	Uncertainty principle, second version	246
12.4	Minimum uncertainty states	249
12.5	Exercises	251
13	Quantization schemes for Euclidean space	255
13.1	Ordering ambiguities	255
13.2	Some common quantization schemes	256
13.3	The Weyl quantization for \mathbb{R}^{2n}	261
13.4	The "no go" theorem of Groenewold	271
13.5	Exercises	275
14	The Stone–von Neumann Theorem	279
14.1	A heuristic argument	279
14.2	The exponentiated commutation relations	281
14.3	The theorem	286

14.4	The Segal–Bargmann space	293
14.5	Exercises	302
15	The WKB approximation	305
15.1	Introduction	305
15.2	The old quantum theory and the Bohr–Sommerfeld Condition	306
15.3	Classical and semiclassical approximations	308
15.4	The WKB approximation away from the turning points	311
15.5	The Airy function and the connection formulas	315
15.6	A rigorous error estimate	320
15.7	Other approaches	329
15.8	Exercises	330
16	Lie groups, Lie algebras, and representations	333
16.1	Summary	334
16.2	Matrix Lie groups	335
16.3	Lie algebras	338
16.4	The matrix exponential	339
16.5	The Lie algebra of a matrix Lie group	342
16.6	Relationships between Lie groups and Lie algebras	344
16.7	Finite-dimensional representations of Lie groups and Lie algebras	350
16.8	New representations from old	358
16.9	Infinite-dimensional unitary representations	360
16.10	Exercises	363
17	Angular momentum and spin	367
17.1	The role of angular momentum in quantum mechanics	367
17.2	The angular momentum operators in \mathbb{R}^3	368
17.3	Angular momentum from the Lie algebra point of view	369
17.4	The irreducible representations of $\mathfrak{so}(3)$	370
17.5	The irreducible representations of $\mathrm{SO}(3)$	375
17.6	Realizing the representations inside $L^2(S^2)$	376
17.7	Realizing the representations inside $L^2(\mathbb{R}^3)$	380
17.8	Spin	382
17.9	Tensor products of representations: “addition of angular momentum”	384
17.10	Vectors and vector operators	387
17.11	Exercises	389
18	Radial potentials and the hydrogen atom	391
18.1	Radial potentials	391
18.2	The hydrogen atom: preliminaries	394
18.3	The bound states of the hydrogen atom	395

18.4	The Runge–Lenz vector in the quantum Kepler problem . .	399
18.5	The role of spin	407
18.6	Runge–Lenz calculations	408
18.7	Exercises	414
19	Systems and subsystems, multiple particles	417
19.1	Introduction	417
19.2	Trace-class and Hilbert–Schmidt operators	419
19.3	Density matrices: the general notion of the state of a quantum system	420
19.4	Modified axioms for quantum mechanics	425
19.5	Composite systems and the tensor product	427
19.6	Multiple particles: bosons and Fermions	431
19.7	“Statistics” and the Pauli Exclusion Principle	434
19.8	Exercises	436
20	The path-integral formulation of quantum mechanics	439
20.1	Trotter Product Formula	440
20.2	Formal derivation of Feynman path-integral	442
20.3	The imaginary-time calculation	445
20.4	The Wiener measure	446
20.5	The Feynman–Kac Formula	447
20.6	Path-integrals in quantum field theory	449
20.7	Exercises	451
21	Hamiltonian mechanics on manifolds	453
21.1	Calculus on manifolds	453
21.2	Mechanics on symplectic manifolds	457
21.3	Exercises	463
22	Geometric quantization on Euclidean space	465
22.1	Introduction	465
22.2	Prequantization	466
22.3	Problems with prequantization	470
22.4	Quantization	472
22.5	Quantization of observables	476
22.6	Exercises	480
23	Geometric quantization on manifolds	481
23.1	Introduction	481
23.2	Line bundles and connections	483
23.3	Prequantization	488
23.4	Polarizations	490
23.5	Quantization without half-forms	493
23.6	Quantization with half-forms: the real case	503

23.7	Quantization with half-forms: the complex case	516
23.8	Pairing maps	519
23.9	Exercises	521
A	Review of basic material	525
A.1	Tensor products of vector spaces	525
A.2	Measure theory	527
A.3	Elementary functional analysis	528
A.4	Hilbert spaces and operators on them	535
	References	543
	Index	547
