MOBILE COMPUTING
CSE 40814/60814
Fall 2015

What is RFID?
• Radio Frequency IDentification
RFID

- ADC (automated data collection) technology that uses radio-frequency waves to transfer data between a reader and a movable item to identify, categorize, track...
- RFID is fast, reliable, and does not require physical sight or contact between reader/scanner and the tagged item
- A close cousin to sensor network technology
- Generally, RFID tags are cheaper, but less “intelligent” than sensor nodes
- As things evolve the line between the two technologies is blurring

Some Historical Background

- Identification Friend or Foe (IFF) Used by Allied bombers during World War II
- In 1948, concept of passive RFID systems introduced by Harry Stockman
- In 1972, Kriofsky and Kaplan designed and patented an “inductively coupled transmitter-responder” (2 antennas)
- In 1979, Beigel designed/patented “identification device” which combined both antennas into one
- In the 1970s, a group of scientists at the Lawrence Livermore Laboratory (LLL) build a handheld receiver stimulated by RF power for secure access to nuclear facilities
RFID Systems

Main components:
- **Tags** (transponders)
  - Microchip & antenna
- **Tag reader**
  - Decoder & antenna
  - RFID reader sends pulse of energy and waits for response
  - Can be on all the time or activate only in response to external event

Variations:
- **Memory**
  - Size (16 bits - 512 Kbytes)
  - Read-Only, Read/Write or WORM
- **Arbitration (Anti-collision)**
  - Ability to read/write one or many tags at a time
- **Frequency**
  - 125KHz - 5.8 GHz
- **Price**
  - $0.10 to $250
- **Physical Dimensions**
  - Thumbnail to Brick sizes
“Mission Impossible”

Tiny Tags

- 2007 Hitachi produced RFID device measuring 0.05×0.05 mm, and thin enough to be embedded in a sheet of paper. The data contained on them can be extracted from as far away as a few hundred meters. Human hair comparison.
### Active versus Passive

<table>
<thead>
<tr>
<th></th>
<th>Active RFID</th>
<th>Passive RFID</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tag Power Source</td>
<td>Internal to tag</td>
<td>Energy transferred using RF from reader</td>
</tr>
<tr>
<td>Tag Battery</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Required signal strength</td>
<td>Very Low</td>
<td>Very High</td>
</tr>
<tr>
<td>Range</td>
<td>Up to 100m</td>
<td>Up to 3-5m, usually less</td>
</tr>
<tr>
<td>Multi-tag reading</td>
<td>1000's of tags recognized – up to 100mph</td>
<td>Few hundred within 3m of reader, about 3 sec per read =&gt; at most 3 mph.</td>
</tr>
<tr>
<td>Data Storage</td>
<td>Up to 512 KB</td>
<td>16 bits – 1 KB</td>
</tr>
</tbody>
</table>

### Active Tag

- Greater range: 20-200m
- 10 yr. Life
- Limited sensor capabilities
- "Self-powered" uses interrogator RF beam for wake-up and communication
Passive Tag

- Limited range: <10m (frequency dependent)
- Communication & power from interrogator RF beam

Frequency Ranges

Low Frequency: Load Modulation

1. An integrated circuit sends a signal to an oscillation, which creates an alternating current in the reader’s coil.
2. The oscillation generates an alternating magnetic field that serves as a power source for the tag.
3. The field interacts with the coil in the tag, which induces a current that causes charge to flow into a capacitor, where it is trapped by the diode.
4. A charge accumulates in the capacitor, the voltage across it also increases and activates the tag’s integrated circuit, which then expresses its identifier code.

Variations in current flow in the reader coil are sensed by a device that converts the pattern to a digital signal. The reader’s integrated circuit then discerns the tag’s identifier code.

High-Frequency: Backscatter Modulation

1. An integrated circuit sends a digital signal to a transmitter, which generates a radio-frequency signal that is transmitted by a dipole antenna.
2. The electric field of the propagating signal gives rise to a potential difference across the tag’s dipole antenna, which causes current to flow into the capacitor; the resulting charge is trapped there by the diode.
3. The voltage across the capacitor, which is based on the tag’s identifier code, is sent as a series of digital high and low-voltage events, corresponding to ones and zeros. The signal moves to the reader.

Variations in the amplitude of the reflected signal, which is called backscatter modulation, correspond to the pattern of the transmitter turning on and off.
4. The transistor gets turned on or off by the highs and lows of the digital signal, alternately causing the antenna to reflect back or absorb some of the incident radio-frequency energy from the reader.

EPC: Electronic Product Code

Creating EPCs

EPC Code - Unique Number - 96 bits long
Smart Tag - Made from microchip w/ antenna - Transmits EPC code
Soda Can - Typical object becomes unique because of "Smart Tag"

Transmitting EPCs

Soda Can - Transmits EPC code from embedded "Smart Tag" on side of can
Reader - Could be found in shelving, appliances, etc. - Transmits EPC to Internet
Internet - Translates EPC code into useful information

EPC

The Electronic Product Code

S-GTIN: 01. 000389. 000162. 00169740

Header (8 bits) - Identifies the EPC's version number and allows for the evolving of different lengths or types of EPC.
EPC Manager (28 bits) - Identifies the manufacturer of the product which it derives from the company's prefix.
Object Class (24 bits) - Refers to the exact type of product which is the GTIN without the prefix or the Main Reference.
Serial Number (36 bits) - The specific serial number of the individual item.
Communication and Collisions

• Very simple packet formats
  • General structure:

    | Sync | Header | Command | Data | CRC |

• Usually reader-to-tag and tag-to-reader format somewhat different.
• Typically 2 byte CRC

Collisions

• All tags receiving query will respond: collisions!
• Many readers feature “simultaneous read” capabilities (resolve collisions)
• Challenges in RFID collision handling:
  • collision detection at sender is not possible
  • no carrier sense possible
Approach 1: Slotted Aloha

- One of the earliest and simplest medium access control protocols
- Aloha: access medium whenever ready to transmit
- Slotted Aloha: only access medium at beginning of slot (can reduce occurrence of collisions)
- Tags choose random backoff (reader can acknowledge tag ID and that tag will not send anymore)

Approach 2: Binary Tree Algorithm

- Poll tags bit-by-bit
- Example (figure):
  - Query "x": 7 tags respond: collision
  - Query "0x": 3 tags respond: collision
  - Query "00x": 1 tag responds
  - Query "01x": 2 tags respond: collision
  - Query "010x": 2 tags respond: collision
  - Query "0100x": 1 tag responds
  - Query "0101x": 1 tag responds
  - Query "011x": no response
  - Query: "1x": 4 tags respond: collision
  - Query: "10x": 1 tag responds
  - Query: "11x": 3 tags respond: collision
  - …
Application Scenarios

- Track the movement of consumer product goods
- Animal identification/tracking/counting
- Toll collection
- Implantation of RFID chips into people, e.g., Alzheimer patients

Applications

- Keyless entry
- Proximity cards
- Supply chain management
Implants

- It is the most controversial application
- Small glass cylinders approximately 2 or 3mm wide and between 1 and 1.5cm long
- Consists of a microchip, a coiled antenna, and a capacitor
- Implanted typically under the skin of arm or the back of the neck

Controversies (2003)

Walmart

- In 2003, Walmart made the retail industry's initial steps with a Radio Frequency Identification (RFID) supplier requirement when it announced a pallet and case level tagging initiative. Currently, over 600 suppliers are participating in the initiative. Today, Walmart requires that its top suppliers must be RFID compliant, at the pallet and outer case level. Many suppliers have already been notified regarding their target compliance dates. As time progresses RFID benefits will continue to surface as well as the technology will become cheaper and easier to integrate.
Near-Field Communication (NFC)

- NFC, is one of the latest wireless communication technologies. As a short-range wireless connectivity technology, NFC offers safe yet simple communication between electronic devices.
- It enables exchange of data between devices over a distance of 4 cm or less.
- NFC operates at 13.56 MHz and rates ranging from 106 kbit/s to 848 kbit/s.

How NFC Works

- NFC is based on RFID technology that uses magnetic field induction between electronic devices in close proximity.
- For two devices to communicate using NFC, one device must have an NFC reader/writer and one must have an NFC tag. The tag is essentially an integrated circuit containing data, connected to an antenna, that can be read or written by the reader.
How NFC Works

- The technology is a simple extension of the ISO/IEC14443 proximity-card standard (contactless card, RFID) that combines the interface of a smartcard and a reader into a single device
- An NFC device can communicate with both existing ISO/IEC14443 smartcards and readers, as well as with other NFC devices, and is thereby compatible with contactless infrastructure already in use for public transportation and payment
- NFC is primarily aimed at usage in mobile phones
- 2015: ~600 million NFC-equipped phones in use (estimate that 5% are used at least once a month)

NFC Applications

There are currently three main uses of NFC:
- **Card emulation**: The NFC device behaves like an existing contactless card
- **Reader mode**: The NFC device is active and reads a passive RFID tag, for example for interactive advertising
- **P2P mode**: Two NFC devices communicating together and exchanging information
NFC Applications

- Mobile payment
- Mobile/electronic ticketing
- Smart objects
- Electronic keys
- P2P data transfers
- NFC can be used to configure and initiate other wireless network connections such as Bluetooth or Wi-Fi
Comparison with Bluetooth

- “Short” vs “very short” ranges (very short has security advantages)
- NFC set up is faster (< 10\(^{th}\) of a second)
  - NFC can be used to configure Bluetooth connections
- NFC data rate: 424kbps; Bluetooth: 721kbps+

Security/Privacy Issues and Solutions

- **Unauthorized Reading:**
  - Scan closed boxes and find out what is inside
  - Read RFID enabled credit card or ID (metal foil in passports)
- **Unauthorized Writing:**
  - Can change UPC/price of an item
  - Can kill a tag
- **RFID Zapper:**
  - Can burn a tag using overcurrent
- **RSA Blocker Tag:**
  - Placed near another RFID; prevents its reading
- **Put Tag to Sleep:**
  - Can wake up later; reuse tags
- **Re-label Tag and Dual-Use Tag:**
  - Customer sees differed info or can over-write tag with useful information
- **Authentication:**
  - Reader has to know PIN
Future of RFID and NFC

Navigating the Airport of Tomorrow

Goods and prices are registered automatically

A Future Internet of Things – IoT

Future, based on RFID, NFC, updates the airport
structures eventually moved into IoT applications
