Math 1B, Spring '10 Quiz 9, April 14

1. (3 points) Match the differential equation with its direction field. Give reasons for your answer.

(b) corresponds to I, because the direction field is horizontal (y'=0) whenever x=0 or y=2

(c) corresponds to IV because the slope at (0,0) is -1.

(d) corresponds to II, because the direction field is horizontal at $y = \pm \pi$.

2. (4 points) Find the solution of the differential equation

$$xy' + y = y^2$$

that satisfies the initial condition y(1) = -1.

Solution. Note first that the equation is separable:

$$xy' = y^2 - y \Leftrightarrow \frac{y'}{y^2 - y} = \frac{1}{x}.$$

Integrating we get

$$\int \frac{dy}{y(y-1)} = \int \frac{dx}{x},$$

or equivalently

$$\ln\left|\frac{y-1}{y}\right| = \ln|x| + c.$$

Exponentiating, we get

$$\left|\frac{y-1}{y}\right| = k|x|.$$

From the initial condition y(1) = -1 we obtain k = 2. Eliminating the absolute value, we get

$$1 - \frac{1}{y} = \pm 2x,$$

but when x = 1, y = -1, so we have to choose the "+" sign. We have

$$1 - \frac{1}{y} = 2x \Leftrightarrow \frac{1}{y} = 1 - 2x \Leftrightarrow y = \frac{1}{1 - 2x}.$$

3. (3 points) Find the orthogonal trajectories of the family of curves

$$y^2 = kx^3$$

Solution. Differentiating $y^2 = kx^3$ we get

$$2ydy = 3kx^2dx \Leftrightarrow \frac{dy}{dx} = k\frac{3x^2}{2y},$$

and since $k = y^2/x^3$, we get

$$\frac{dy}{dx} = \frac{y^2}{x^3} \cdot \frac{3x^2}{2y} = \frac{3y}{2x}.$$

The orthogonal trajectories then satisfy the differential equation

$$\frac{dy}{dx} = \frac{-1}{\frac{3y}{2x}} = \frac{-2x}{3y},$$

which is separable. We get

$$3ydy = -2xdx$$

and by integration

$$\int 3y dy = \int -2x dx \Leftrightarrow \frac{3}{2}y^2 = -x^2 + C \Leftrightarrow y = \pm \sqrt{\frac{2}{3}(-x^2 + C)}.$$
