Annual Research Summary

January - December 2010

Kamat Research Group
University of Notre Dame
2010 Activities/ Highlights

Research Group

Graduate Students
- Yunghai Yu (Chem. Eng. - coadvisor Ken Kuno)
- David Baker (Chem. Eng.)
- Kevin Tvrdy (Chemistry)
- Clifton Harris (Chemistry)
- Matt Becker (Physics - coadvisor Bruce Bunker)
- Ian Lightcap (Chemistry)
- Ben Meekins (Chem Eng.)
- Sachi Krishnamurthy (Chemistry)
- Sean Murphy (Chemistry - coadvisor Libai Huang)
- James Radich (Chem. Eng.)
- Thibaut Viguier (Chem. Eng. – till Summer 2010)

Incoming Students
- Douglas Hines (Chemistry)
- Jeff Christians (Chem. Eng.)

Undergraduate Students

Spring 2010
- Peter Lobaccaro (CBE, UND)
- Ryan P. Dwyer (Chemistry, UND)
- Veronica Tsou (Waterloo)

Summer 2010
- Ryan P. Dwyer (Chemistry, UND)
- Peter Lobaccaro (CBE, UND)
- Tim Schumer (CBE, UND)
- Sarah Schubert (Chemistry, UND)

Fall 2010
- Douglas Pernik (Chemistry, UND)
- Ryan P. Dwyer (Chemistry, UND)
- Peter Lobaccaro (CBE, UND)
- Sarah Schubert (Chemistry, UND)
- Susan Garabedian (CBE, UND)

Postdoctoral Research Associate
- Jin Ho Bang (Jan-July 2010)
- Alexsandra Wojcik (Jan-Aug 2010)
- Yoon-Ho Jun (June 2010-)
- Hyunbong Choi (Nov 2010-)
Visiting Scientists
K. Vinodgopal and Julie Peller (IUN)
Roxana Nicolaescu (Serim Corporation)
Azusa Takai (Waseda University)
Ken-ichi Matsuoka (Kyushu University)

Awards/Fellowships/Recognition

Yanghai Yu, Successful completion of his Ph. D. Thesis (July 2010)
Douglas Pernik, Slatt Fellowship for undergraduate research (2010-2011)
Ian Lightcap, Winner of 2009-10 Notre Dame Graduate Student Research Symposium
(Science Div, Jan 22, 2010).
Prashant Kamat, recognition by the provost at the home football game against Tulsa.

Professional Activities

- Deputy Editor, Journal of Physical Chemistry Letters (2009-present)
- Executive Editor, Journal of Physical Chemistry A/B/C (2008-present)
- Editorial Advisory Boards
  - Langmuir (2000-present)
  - Interface (1999-present)
  - Electrochemical and Solid State Letters (September 2006-present)
  - Applied Electrochemistry (2009-present)
- Committees
  - Awards and Honors Committee of the Electrochemical Society (2007-2011)
- ND committees
  - Member of the COS-COS (2008-present)
  - CAP –Chemistry & Biochemistry (Fall 2009-)
  - Sustainable Energy Institute Leadership Team (2010-)
- Symposium Organizer
  - Symposium Organizer: Coorganizer, Nanostructures for Energy Conversion, 217th ECS Meeting Vancouver, Canada April 25-30, 2010
Invited Seminar/Colloquium

Kyoto University September 1-7, 2010.
  Kamat, P. V. How to communicate your research effectively.
  Kamat, P. V. Light energy conversion with nanostructured semiconductor.
  Kamat, P. V. Solar cells by design. Manipulating charge transfer at semiconductor interfaces

National Taiwan University, Taiwan. August 3, 2010.
  Kamat, P. V. (2010). How to communicate your research effectively?
  Kamat, P. V. (2010). Solar cells by design, manipulating charge transfer at nanostructure interfaces

  Kamat, P. V. Manipulation of semiconductor nanoarchitectures for light energy conversion.

Jawaharial Nehru Center for Adv. Sci. Research, India. October 5-6, 2010
  Kamat, P. V. Carbon nanostructures for energy conversion.
  Kamat, P. V. Publish or perish: Ethics of scientific publication.

IGERT Seminar, Univ. of Massachusetts, Amherst, Dec. 3, 2009
  Kamat, P. V. Solar Cells by Design. Manipulating Charge Transfer at Nanostructure Interfaces

Recognition by the Provost Tom Burrish at the ND home football game against Tulsa.
Conference Presentations (2010):

Kamat, P. V. Nanostructure Nanoassemblies for Next Generation Solar Cells

NSF Advanced Studies Institute on "Nanomaterials and Nanocatalysis for Energy Photochemicals and Environmental Applications", Cairo, Egypt.

Kamat, P. V. Nanostructure nanoassemblies to next generation solar cells.

Spring Meeting of the Electrochemical Society Meeting, Vancouver, Canada April 25-30, 2010

Kamat, P. V. Graphene oxide as 2-D carbon support to anchor semiconductor and metal nanoparticles.

Keynote Speaker, Graduate Student Symposium, University of Buffalo, May 14, 2010

Kamat, P. V., Nanostructure Assemblies for Next Generation Solar Cells

DOE Solar Photochemistry Conference, Annapolis, June 2010

Kamat, P. V., Tvrdy, K., Meekins, B., Lightcap, I., Baker, D., Bang J. H. Manipulation of Charge Transfer Processes in Semiconductor Quantum Dot Based Nanoarchitectures

Fullerene-nanotubes General Symposium, Kyoto, Japan. Sept 5-7, 2010

Kamat, P. V. Carbon nanostructures for energy conversion.

Midwest Regional Conference, AIChE, Chicago, IL, October 1, 2010

Baker, D. and Kamat, P. V. Overcoming losses at the counter electrode in quantum dot solar cells by salt bridge isolation

Kamat, P. V. Excited state dynamics of quantum dot sensitized solar cells.

National Institute for Materials Science (NIMS Conference), Tsukuba, Japan, July 12-14, 2010

Kamat, P. V. Exploitation of nanostructure interface for light energy conversion.

18th International Conf. on Photochemical Conversion and Storage of Solar Energy, Seoul, Korea, July 25-30, 2010

Kamat, P. V. Quantum dot solar cells, exploitation of nanostructure for efficient charge transfer.

Gordon Reaearch Conference on Radiation Chemistry, Andover, NH, July 18-23, 2010

Wojcik, A. and P. V. Kamat Spectroscopic and photoelectrochemical characterization of near-infrared responsive squaraine dyes.

Postdoctorate to Faculty Workshop. Sponsored by ACS and NSF, August 21, 2010.

Kamat, P. V. (2010). Publish or perish.

American Chemical Society Fall Meeting, Boston, MA, August 22-26, 2010

Kamat, P. V. Modulating interparticle electron transfer in quantum dot solar cells.

Kamat, P. V. Quantum dot sensitized solar cells, mapping photoinduced charge transfer processes.

Murphy, S. J., Postnikoff, C., Huang, L., Kamat, P. V. Ultrafast transient absorption and surface enhanced Raman of photosynthetic reaction centers linked to silver nanoparticles

Sixth JNC Research Conference on Chemistry of Materials, Cochin, Kerala, India, Oct 2-4, 2010

Squaraine Rotaxane as Optical Chloride Sensor

Gassensmith, J. J.; Matthys, S.; Wojcik, A.; Kamat, P. V.; Smith, B. D.
*Chemistry, European J.* 2010, 16, 2916-2921
DOI: 10.1002/chem.200902547

**Abstract**
A mechanically interlocked squaraine rotaxane is comprised of a deep-red fluorescent squaraine dye inside a tetralactam macrocycle. NMR studies show that Cl\(^-\) binding to the rotaxane induces macrocycle translocation away from the central squaraine station, a process that is completely reversed when the Cl\(^-\) is removed from the solution. Steady-state fluorescence and excited-state lifetime measurements show that this reversible machine-like motion modulates several technically useful optical properties, including a three-fold increase in deep-red fluorescence emission that is observable to the naked eye. The fluorescence intensity of a dipstick increased eighteen-fold upon dipping in an aqueous solution of tetrabutylammonium chloride (300 mM) and was subsequently reversed by washing with pure water. It is possible to develop the dipsticks for colorimetric determination of Cl\(^-\) levels by the naked eye.

Supramolecular Donor-Acceptor Assemblies Composed of Carbon Nanodiamond and Porphyrin for Photoinduced Electron Transfer and Photocurrent Generation

Ohtani, M.; Kamat, P. V.; Fukuzumi, S.
*J. Mater. Chem.* 2010, 20, 582-587
DOI: 10.1039/B916634C

**Abstract**
Supramolecular donor–acceptor assemblies composed of carbon nanodiamond (ND) and porphyrin (Por) are constructed through interensemble hydrogen bonding and π–π interactions. Formation of the supramolecular clusters composed of ND and porphyrin has been confirmed by transmission electron microscopy (TEM), dynamic light scattering (DLS), and IR spectroscopy. The resulting supramolecular clusters have been assembled as three-dimensional arrays onto nanostructured SnO\(_2\) films using an electrophoretic deposition method for the test of photoelectrochemical properties. Enhancement in the photoelectrochemical performance as well as the broader photoresponse in the visible region is seen with formation of the supramolecular clusters between ND and porphyrins as compared with the reference system without porphyrins.
Anchoring Semiconductor and Metal Nanoparticles on a 2-Dimensional Catalyst Mat. Storing and Shuttling Electrons with Reduced Graphene Oxide

Lightcap, I. V.; Kosel, T. H.; Kamat, P. V.
*Nano Lett.* **2010**, *10*, 577–583
DOI: 10.1021/nl9035109

**Abstract**
Using reduced graphene oxide (RGO) as a two-dimensional support, we have succeeded in selective anchoring of semiconductor and metal nanoparticles at separate sites. Photogenerated electrons from UV-irradiated TiO$_2$ are transported across RGO to reduce silver ions into silver nanoparticles at a location distinct from the TiO$_2$ anchored site. The ability of RGO to store and shuttle electrons, as visualized via a stepwise electron transfer process, demonstrates its capability to serve as a catalyst nanomat and transfer electrons on demand to adsorbed species. These findings pave the way for the development of next generation catalyst systems and can spur advancements in graphene-based composites for chemical and biological sensors.

A CdSe Nanowire/Quantum Dot Hybrid Architecture for Improving Solar Cell Performance

Yu, Y.; Kamat, P. V.; Kuno, M.
DOI: 10.1002/adfm.200902372

**Abstract**
Incorporating colloidal CdSe quantum dots (QDs) into CdSe nanowire (NW)-based photoelectrochemical solar cells increases their incident-photon-to-carrier conversion efficiencies (IPCE) from 13% to 25% at 500 nm. While the effect could, in principle, stem from direct absorption and subsequent carrier generation by QDs, the overall IPCE increase occurs across the entire visible spectrum, even at wavelengths where the dots do not absorb light. This beneficial effect originates from an interplay between NWs and QDs where the latter fill voids between interconnected NWs, providing electrically accessible conduits, in turn, enabling better carrier transport to electrodes. The presence of QDs furthermore reduces the residual polarization anisotropy of random NW networks. Introducing QDs therefore addresses an important limiting constraint of NW photoelectrochemical solar cells. The effect appears to be general and may aid the future design and implementation of other NW-based photovoltaics.
Modulation of Electron Injection in CdSe-TiO₂ System through Medium Alkalinity

Chakrapani, V.; Tvrdy, K.; Kamat, P. V.
**DOI:** 10.1021/ja909663r

**Abstract**
Charge injection from excited CdSe quantum dots into nanostructured TiO₂ film can be modulated by varying solution pH. At increasing solution pH, the conduction band of TiO₂ shifts 59 mV/pH unit to a more negative potential, thereby decreasing the driving force and thus decreasing the rate of nonradiative electron transfer from excited CdSe. The emission yield and the average emission lifetime increase with increasing pH, thus providing a way to monitor the variation in medium pH.

Graphene based Nanoarchitectures. Anchoring Semiconductor and Metal Nanoparticles on a 2-Dimensional Carbon Support

Kamat, P. V.
*J. Phys. Chem. Lett.* **2010**, *1*, 520-527
**DOI:** 10.1021/jz900265j

**Abstract**
Graphene based two-dimensional carbon nanostructures serve as a support to disperse catalyst nanoparticles. Reduced graphene oxide is used as a support to anchor semiconductor and metal nanoparticles. Such a design strategy would enable the development of a multifunctional catalyst mat. This Perspective focuses on the interaction between graphene oxide–semiconductor (TiO₂, ZnO) and graphene oxide–metal (Au, Pt) nanoparticles and discusses potential applications in catalysis, light energy conversion, and fuel cells.
**Solar Cell by Design. Photoelectrochemistry of TiO$_2$ Nanorod Arrays Decorated with CdSe**

Bang, J. H.; Kamat, P. V.
DOI: 10.1002/adfm.200902234

**Abstract**

One-dimensional (1D) nanostructures of TiO$_2$ are grown directly on transparent, conductive glass substrate using hydrothermal/solvothermal methods. When employed as a photoanode in photoelectrochemical cells, the vertically aligned TiO$_2$ nanorod array exhibits slower charge recombination at electrolyte interface as compared to mesoscopic TiO$_2$ particulate film. Electrochemical deposition of CdSe onto TiO$_2$ nanorod array is carried out to extend absorption into visible light region. The role of CdSe-sensitized, 1D rutile TiO$_2$ architecture in the solar cell design is discussed.

**Photochemistry of Far Red Responsive Tetrahydroquinoxaline-Based Squaraine Dyes**

Wojcik, A.; Nicolaescu, R.; Kamat, P. V.; Patil, S.
DOI: 10.1021/jp9118887

The photochemical and redox properties of two newly synthesized tetrahydroquinoxaline-based squaraine dyes (SQ) are investigated using femto- and nanosecond laser flash photolysis, pulse radiolysis, and cyclic voltammetry. In acetonitrile and dichloromethane, these squaraines exist as monomers in the zwitterionic form ($\lambda_{\text{max}} \approx 715$ nm, $\epsilon_{\text{max}} \approx 1.66 \times 10^5$ M$^{-1}$ cm$^{-1}$ in acetonitrile). Their excited singlet states ($^1$SQ*) exhibit a broad absorption band at 480 nm, with singlet lifetimes of 44 and 123 ps for the two dyes. The excited triplet states of the squaraine dyes exhibit a broad absorption band at ca. 560 nm ($\epsilon_{\text{triplet}} \approx 4.2 \times 10^4$ M$^{-1}$ cm$^{-1}$) and undergo deactivation via triplet–triplet annihilation and ground-state quenching processes. The oxidized forms of the investigated squaraines (SQ$^{+}$) exhibit absorption maxima at 510 and 610 nm.
Tuning the Emission of CdSe Quantum Dots by Controlled Trap Enhancement

David R. Baker and Prashant V. Kamat*
Langmuir 2010, 26, 11272-11276
DOI: 10.1021/la100580g

Abstract
Ligand exchange with 3-mercaptopropionic acid (MPA) has been successfully used to tune the emission intensity of trioctylphosphineoxide/dodecylamine-capped CdSe quantum dots. Addition of 3-mercaptopropionic acid (MPA) to CdSe quantum dot suspension enhances the deep trap emission with concurrent quenching of the band edge emission. The smaller sized quantum dots, because of larger surface/volume ratio, create a brighter trap emission and are more easily tuned. An important observation is that the deep trap emission which is minimal after synthesis is brightened to have a quantum yield of 1–5% and can be tuned based on the concentration of MPA in solution with the quantum dots. Photoluminescence decay and transient absorption measurements reveal the role of surface bound MPA in altering the photophysical properties of CdSe quantum dots.

Sonolytic Design of Graphene Au Nanocomposites. Simultaneous and Sequential Reduction of Graphene Oxide and Au(III)

Vinodgopal, K.; Neppolian, B.; Lightcap, I. V.; Grieser, F.; Ashokkumar, M.; Kamat, P. V.
DOI: 10.1021/jz1006093

Abstract
High-frequency ultrasound at 211 kHz is effective in developing graphene-based nanoarchitectures. Both simultaneous and sequential reduction steps have been employed to reduce the graphene oxide (GO) and a gold precursor, HAuCl4. Characterization of the composites by transmission electron microscopy following the reduction process revealed well-dispersed Au nanoparticles on the reduced GO (RGO) sheets that are no more than a few layers thick (1–4 layers). The Raman spectra of the RGO–Au composites showed a distinct surface enhancement of the graphene Raman bands upon increasing the surface coverage of gold nanoparticles. The merits of sonolytic reduction in developing graphene-based composites are discussed.
To What Extent Do Graphene Scaffolds Improve the Photovoltaic and Photocatalytic Response of TiO₂ Nanostructured Films?

Ng, Y. H.; Lightcap, I. V.; Goodwin, K.; Matsumura, M.; Kamat, P. V.

*J. Phys. Chem. Lett.* **2010**, *1*, 2222–2227

**DOI:** 10.1021/jz100728z

**Abstract**

Graphene−TiO₂ nanocomposites synthesized via a solution-based method involving photocatalytic reduction of graphene oxide have been employed as photoanodes. Nearly 90% enhancement in the photocurrent is seen as reduced graphene oxide serves as electron collector and transporter. Additionally, the graphene−TiO₂ nanocomposite electrodes exhibit significant activity for the complete photocatalytic decomposition of 2,4-dichlorophenoxyacetic acid (2,4-D). Combined with safe, solution-based synthetic practices, the promising photocurrent and photocatalytic degradation rates provide the framework and motivation for the implementation of graphene−TiO₂ nanocomposites on larger scales.

Tailored TiO₂−SrTiO₃ Heterostructure Nanotube Arrays for Improved Photoelectrochemical Performance,

Zhang, J.; Bang, J. H.; Tang, C.; Kamat, P. V.

**DOI:** 10.1021/nn901087c

**Abstract**

TiO₂ nanotube arrays formed on Ti substrate by electrochemical anodization have been converted into TiO₂−SrTiO₃ heterostructures by controlled substitution of Sr under hydrothermal conditions. The growth of SrTiO₃ crystallites on the nanotube array electrode was probed by electron microscopy and X-ray diffraction. As the degree of Sr substitution increases with the duration of hydrothermal treatment, an increase in the size of SrTiO₃ crystallites was observed. Consequently, with increasing SrTiO₃ fraction in the TiO₂−SrTiO₃ nanotube arrays, we observed a shift in the flat band potential to more negative potentials, thus confirming the influence of SrTiO₃ in the modification of the photoelectrochemical properties. The TiO₂−SrTiO₃ composite heterostructures obtained with 1 h or less hydrothermal treatment exhibit the best photoelectrochemical performance with nearly 100% increase in external quantum efficiency at 360 nm. The results presented here provide a convenient way to tailor the photoelectrochemical properties of TiO₂−SrTiO₃ nanotube array electrodes and employ them for dye- or quantum-dot-sensitized solar cells and/or photocatalytic hydrogen production.
**Beyond photovoltaics: semiconductor nanoarchitectures for liquid junction solar cells**

Kamat, P. V.; Tvrdy, K.; Baker, D. R.; Radich, J. G.

DOI: 10.1021/cr100243p

**Abstract**

Liquid-junction photoelectrochemical solar cells make use of the principles of photochemistry, electrochemistry, and semiconductor physical chemistry. The field of photoelectrochemistry has nurtured the development and design of next-generation solar cells. This field, which originated with single-crystal semiconductor electrochemistry in the 1960s, has now expanded to nanostructured semiconductor electrodes. Basic research at the semiconductor/electrolyte interface continues to draw the attention of scientists around the world. The recent technological advances in the commercialization of dye sensitized solar cells have provided a further boost to the development of photoelectrochemical solar cells.

**Reduced Graphene Oxide and Porphyrin. An Interactive Affair in 2-D**

Wojcik, A.; Kamat, P. V.

DOI: 10.1021/nn102185q

**Abstract**

Photoexcited cationic 5,10,15,20-tetrakis(1-methyl-4-pyridinio)porphyrin tetra(p-toluenesulfonate) (TMPyP) undergoes charge-transfer interaction with chemically reduced graphene oxide (RGO). Formation of the ground-state TMPyP–RGO complex in solution is marked by the red-shift of the porphyrin absorption band. This complexation was analyzed by Benesi–Hildebrand plot. Porphyrin fluorescence lifetime reduced from 5 to 1 ns upon complexation with RGO, indicating excited-state interaction between singlet excited porphyrin and RGO. Femtosecond transient absorption measurements carried out with TMPyP adsorbed on RGO film revealed fast decay of the singlet excited state, followed by the formation of a longer-living product with an absorption maximum around 515 nm indicating the formation of a porphyrin radical cation. The ability of TMPyP–RGO to undergo photoinduced charge separation was further confirmed from the photoelectrochemical measurements. TMPyP–RGO coated conducting glass electrodes are capable of generating photocurrent under visible excitation. These results are indicative of the electron transfer between photoexcited porphyrin and RGO. The role of graphene in accepting and shuttling electrons in light-harvesting assemblies is discussed.
**Photocatalytic Events of CdSe Quantum Dots in Confined Media. Electrodic Behavior of Coupled Platinum Nanoparticles**

Harris, C.; Kamat, P. V.
DOI: 10.1021/nn102564x

**Abstract**

The electrodic behavior of platinum nanoparticles (2.8 nm diameter) and their role in influencing the photocatalytic behavior of CdSe quantum dots (3.4 nm diameter) has been evaluated by confining both nanoparticles together in heptane/dioctyl sulphosuccinate/water reverse micelles. Electron transfer from CdSe to Pt is found to occur with a rate constant of $1.22 \times 10^9 \text{ s}^{-1}$. With the use of methyl viologen (MV$^{2+}$) as a probe molecule, the role of Pt in the photocatalytic process is established. Ultrafast oxidation of the photogenerated MV$^+$ radicals indicates that Pt acts as an electron sink, scavenging electrons from MV$^{2+}$ with a rate constant of $3.1 \times 10^9 \text{ s}^{-1}$. The electron transfer between MV$^+$ and Pt, and a drastically lower yield of MV$^{2+}$ under steady state irradiation, confirms the ability of Pt nanoparticles to discharge electrons quickly. The kinetic details of photoinduced processes in CdSe–Pt assemblies and the electrodic behavior of Pt nanoparticles provide important information for the development of light energy conversion devices.

**Photoinduced Electron Transfer from Semiconductor Quantum Dots to Metal Oxide Nanoparticles.**

Kevin Tvrdy.; Pavel A. Frantsuzov.; Prashant V. Kamat
doi:10.1073/pnas.1011974107.

**Abstract**

Quantum dot-metal oxide junctions are an integral part of next generation solar cells, light emitting diodes, and nanostructured electronic arrays. We present for the first time a comprehensive examination of electron transfer at these junctions, using a series of CdSe quantum dot donors (sizes 2.8, 3.3, 4.0, and 4.2nm) and metal oxide nanoparticle acceptors (SnO$_2$, TiO$_2$, and ZnO). Apparent electron transfer rate constants showed strong dependence on change in system free energy, exhibiting a sharp rise at small driving forces followed by a modest rise further away from the characteristic reorganization energy. The observed trend mimics the predicted behavior of electron transfer from a single quantum state to a continuum of electron accepting states, such as those present in the conduction band of a metal oxide nanoparticle.
Harvesting Solar Energy at Notre Dame.
50 kW photovoltaic panels installed on the roof of Stinson Remick Hall went on operation in 2010. This new building is also the home of Sustainable Energy Institute and ND Nano.
