TABLE OF CONTENTS

LIST OF TABLES..........................................................................................................vi

LIST OF FIGURES.........................................................................................................viii

ACKNOWLEDGEMENTS...............................................................................................xiv

CHAPTER 1: INTRODUCTION.....................................................................................1
  1.1 Introduction..........................................................................................................1
  1.2 Literature Review...............................................................................................4
  1.3 Applications.........................................................................................................7
    1.3.1 Ship/Offshore applications...........................................................................
    1.3.2 Structural Applications..............................................................................11
  1.4 Motivation of Present Work..............................................................................16
  1.5 Organization of Dissertation..........................................................................18

CHAPTER 2: MODELING OF SLOSHING..............................................................20
  2.1 Introduction.......................................................................................................20
    2.1.1 Numerical Modeling of TLDs...................................................................
    2.1.2 Mechanical Modeling of TLDs..................................................................
  2.2 Sloshing-Slamming (S2) Damper Analogy......................................................24
    2.2.1 Liquid Sloshing...........................................................................................
    2.2.2 Liquid Slamming.......................................................................................25
    2.2.3 Proposed Sloshing-Slamming (S2) Analogy..........................................26
    2.2.4 Numerical Study.......................................................................................31
    2.2.5 Base Shear Force.....................................................................................33
  2.3 Impact Characteristics model.........................................................................34
  2.4 Equivalent Linear Models...............................................................................37
    2.4.1 Harmonic Linearization..........................................................................37
    2.4.2 Statistical Linearization..........................................................................38

ii
2.5 Concluding Remarks..................................................................................................................40

CHAPTER 3: TUNED LIQUID COLUMN DAMPERS.............................................................41
3.1 Introduction.............................................................................................................................41
3.2 Modeling of Tuned Liquid Column Dampers.................................................................43
  3.2.1 Equivalent Linearization:.........................................................................................44
  3.2.2 Accuracy of Equivalent linearization.................................................................45
3.3 Optimum Absorber Parameters.........................................................................................47
  3.3.1 White Noise excitation.......................................................................................50
  3.3.2 First Order Filter (FOF)....................................................................................53
  3.3.3 Second Order Filter (SOF)................................................................................55
  3.3.4 Example.............................................................................................................56
3.4 Multiple Tuned Liquid Column Dampers (MTLCDs) ....................................................57
  3.4.1 Effect of Number of dampers............................................................................59
  3.4.2 Effect of damping ratio of dampers.................................................................59
  3.4.3 Effect of Frequency range..............................................................................60
3.5 Concluding Remarks..........................................................................................................63

CHAPTER 4: BEAT PHENOMENON.............................................................................65
4.1 Introduction...........................................................................................................................65
4.2 Behavior of SDOF system with TLCD...........................................................................68
  4.2.1 Case 1: Undamped Combined System............................................................68
  4.2.2 Case 2: Linearly Damped Structure with Undamped Secondary System...71
  4.2.3 Case 3: Damped Primary and Secondary System........................................74
4.3 Experimental Verification.................................................................................................79
4.4 Concluding Remarks.......................................................................................................80

CHAPTER 5: SEMI-ACTIVE SYSTEMS AND APPLICATIONS.................................81
5.1 Introduction.........................................................................................................................81
5.2 Gain-scheduled Control.....................................................................................................82
  5.2.1 Determination of Optimum Headloss Coefficient.........................................83
5.3 Applications.........................................................................................................................86
  5.3.1 Example 1: SDOF-TLCD system under random white noise.........................86
  5.3.2 Example 2: Application to Offshore Structure..............................................88
5.4 Clipped-Optimal System.................................................................................................92
  5.4.1 Control Strategies...........................................................................................95
8.3.1 Decision analysis framework ................................................................. 159  
8.3.2 Reliability Analysis ............................................................................... 162  
8.3.3 Cost and Utility Analysis ...................................................................... 165  
8.3.4 Risk-based Decision Analysis ............................................................... 166  
8.4 Design of Dampers .................................................................................. 167  
8.4.1 Design Guidelines .................................................................................. 167  
8.4.2 Control Strategy ................................................................................... 169  
8.4.3 Design Procedure .................................................................................. 170  
8.4.4 Technology ........................................................................................... 174  
8.5 Concluding Remarks ................................................................................ 176  

CHAPTER 9: CONCLUSIONS ................................................................. 177  

APPENDIX ........................................................................................................ 181

Figure 2.5  Comparison of experimental results with S2 simulation results: (a), (b): experimental results; (c), (d): simulation results for $\Omega = 1.0$ and 0.9......32

Figure 2.6  (a) schematic of the jump phenomenon (b) Variation of the non-dimensionalized base shear force with the frequency ratio. (experimental results taken from Fujino et al. 1992)..........................................................33

Figure 2.7  Non dimensional interaction force curves for different $\eta$ .........................36

Figure 3.1  Schematic of the Structure-TLCD system .................................................43

Figure 3.2  Exact (Non-linear) and Equivalent Linearization results............................46

Figure 3.3  Time histories for $\zeta = 75$ .......................................................................46

Figure 3.4  Variation of dynamic magnification factor with the head-loss coefficient and frequency ratio for a TLCD.................................................................47

Figure 3.5  Comparison of optimum absorber parameters for a TLCD with varying $\alpha$ and a TMD........................................................................................................51

Figure 3.6  Transfer function of the filters and the primary system: (a) first order filters (b) second order filters...............................................................................55

Figure 3.7  MTLCD configuration ..................................................................................58

Figure 3.8  Effect of number of dampers on the frequency response of SDOF-MTLCD system...........................................................................................................61

Figure 3.9  Effect of damping ratio of the dampers on the frequency response of SDOF-MTLCD system............................................................................................61

Figure 3.10  Effect of frequency range on the frequency response of SDOF-MTLCD system..................................................................................................................62

Figure 4.1  Different coupled system (a) Vibration absorber (b) Coupled penduli system (c) Electrical system (d) Fluid coupling within two cylinders.......66

Figure 4.2  Uncontrolled and Controlled response of a structure combined with (a) TLD (b) TLCD................................................................................................................67

Figure 4.3  Different combined systems ........................................................................68
Figure 4.4  Phase plane portraits of the undamped coupled system

Figure 4.5  Time histories of primary system displacement for $\alpha=0$ and $\alpha=0.6$

Figure 4.6  Variation of $\omega_A$ and $\omega_B$ and as a function of $\alpha$

Figure 4.7  Time histories of response for $\zeta_1=0.005$ and $\zeta_1=0.05$

Figure 4.8  Anatomy of the damped response signature

Figure 4.9  Time histories of response for $\xi=0.2,2$ and $50$

Figure 4.10  Modal frequencies and modal damping ratios of combined system as a function of the damping ratio of the TLCD

Figure 4.11  Phase-plane 3D plots (a) uncoupled system (b) case 1: undamped system (c) case 2: system with damping in primary system only (d) case 3: system with damping in both primary and secondary systems

Figure 4.12  Experimental setup for combined structure-TLCD system on a shaking table

Figure 4.13  Experimental free vibration response with different orifice openings ($\theta=0$ fully open)

Figure 5.1  Gain scheduling concept

Figure 5.2  Flowchart of the two algorithms (a) iterative method (b) direct method

Figure 5.3  Iterative method (a) convergence of response quantities (b) optimum headloss coefficient

Figure 5.4  Variation of optimum headloss coefficient with loading intensity: white noise excitation

Figure 5.5  Example 1: SDOF system under random excitation

Figure 5.6  (a) Single degree of freedom idealization of the offshore structure (b) Concept of Liquid Dampers in TLPs

Figure 5.7  Optimal Absorber parameters as a function of loading conditions
Figure 5.8  (a) Variation of Optimal headloss coefficient with loading conditions for different wave spectra (b) Spectra of structural acceleration at $U_{10}=20$ m/s for different $\xi$...

Figure 5.9  Semi-active TLCD-Structure combined system.

Figure 5.10  Schematic of the control system.

Figure 5.11  Schematic of 5DOF building with semi-active TLCD on top story.

Figure 5.12  Wind loads acting on each lumped mass.

Figure A.1 (a) Variation of Valve Conductance (b) Variation of headloss coefficient
with the angle of valve opening.........................................................................................183
ACKNOWLEDGEMENTS

I would like to first thank my advisor and guru, Prof. Ahsan Kareem, who provided encouragement, support and friendship throughout the length of my stay at Notre Dame. The confidence he placed in me has been instrumental in my professional development. I would also like to thank my committee members, particularly Prof. Bill Spencer and Prof. Jeff Kantor, who guided me through many concepts in dynamics and control. I would also like to thank Prof. Yahya Kurama and Prof. Steven Skaar for their valuable guidance and constructive comments. I would also like to thank the staff in the Department of Civil Engineering and Geological Sciences, particularly Tammy, Molly and Chris. Our laboratory technician, Brent Bach, helped me in most stages of the experiments.

Next, I would like to thank my family, both in India and the U.S., who have constantly supported me during my years in graduate school. Thank you Amma, Daddy, Kumar, Chinni and others. I don’t know what I would have done without my friends: Cass, Vicky, Adrish and all the other long lasting friendships I made at Notre Dame. Finally, many thanks to the wonderful campus of the University of Notre Dame whose lakes, Grotto and Fischer graduate apartments provided a home away from home and a wonderful place to grow and learn.
